**Vertex Cover Kernelization Revisited:
Upper and Lower Bounds for a Refined Parameter**

Joint work with Hans Bodlaender

*STACS 2011, Dortmund
March 10th, 2011*

Vertex Cover

- Input: Graph G , integer k
- Question: Does G have a vertex cover of size $\leq k$?

Vertex Cover

- Input: Graph G , integer k
- Question: Does G have a vertex cover of size $\leq k$?

Vertex Cover

- Input: Graph G , integer k
- Question: Does G have a vertex cover of size $\leq k$?

S is a Vertex Cover of $G \Leftrightarrow$ Graph $G - S$ is edgeless

Preprocessing for Vertex Cover

- Preprocess by computing a small, equivalent instance in polynomial time
- Reduce (G,k) to an equivalent instance on $f(k)$ vertices

Preprocessing for Vertex Cover

- Preprocess by computing a small, equivalent instance in polynomial time
- Reduce (G,k) to an equivalent instance on $f(k)$ vertices

$O(k^2)$

- Sam Buss [SIAM J. Comput. 1993]
- High-degree rule

Preprocessing for Vertex Cover

- Evidence that factor 2 is optimal under UGC

Relevant values of k

- Consider instance (G,k) of Vertex Cover
- Compute a 2-approximation set S in linear time
 - $VC(G) \leq |S| \leq 2 VC(G)$

Relevant values of k

- Consider instance (G,k) of Vertex Cover
- Compute a 2-approximation set S in linear time
 - $VC(G) \leq |S| \leq 2 VC(G)$

$$k < |S|/2$$

- $k < VC(G)$
- Output **NO**

Relevant values of k

- Consider instance (G, k) of Vertex Cover
- Compute a 2-approximation set S in linear time
 - $VC(G) \leq |S| \leq 2 VC(G)$

$$k < |S|/2$$

- $k < VC(G)$
- Output **NO**

$$k \geq |S|$$

- $k \geq VC(G)$
- Output **YES**

Relevant values of k

- Consider instance (G,k) of Vertex Cover
- Compute a 2-approximation set S in linear time
 - $VC(G) \leq |S| \leq 2 VC(G)$

$$k < |S|/2$$

- $k < VC(G)$
- Output **NO**

$$k \geq |S|$$

- $k \geq VC(G)$
- Output **YES**

- In interesting situations we have:
 - $VC(G) / 2 \leq k \leq 2 VC(G)$

Relevant values of k

- Consider instance (G,k) of Vertex Cover
- Compute a 2-approximation set S in linear time
 - $VC(G) \leq |S| \leq 2 VC(G)$

$$k < |S|/2$$

- $k < VC(G)$
- Output **NO**

$$k \geq |S|$$

- $k \geq VC(G)$
- Output **YES**

- In interesting situations we have:
 - $VC(G) / 2 \leq k \leq 2 VC(G)$
- So for relevant instances **k is $\Theta(VC(G))$**

Alternative parameterizations

- Existing results guarantee that the size of instance (G,k) of Vertex Cover can be reduced to $O(VC(G))$ vertices
 - In polynomial time, without changing the answer

Alternative parameterizations

- Existing results guarantee that the size of instance (G,k) of Vertex Cover can be reduced to $O(VC(G))$ vertices
 - In polynomial time, without changing the answer
- $VC(G)$ is just a measure of the complexity of a graph

Alternative parameterizations

- Existing results guarantee that the size of instance (G,k) of Vertex Cover can be reduced to $O(\text{VC}(G))$ vertices
 - In polynomial time, without changing the answer
- $\text{VC}(G)$ is just a measure of the complexity of a graph
- Take any measure Π which maps graphs to \mathbf{N} , and ask:
 - Can we reduce an instance (G,k) to $\text{poly}[\Pi(G)]$ vertices?

Alternative parameterizations

- Existing results guarantee that the size of instance (G,k) of Vertex Cover can be reduced to $O(VC(G))$ vertices
 - In polynomial time, without changing the answer
- $VC(G)$ is just a measure of the complexity of a graph
- Take any measure Π which maps graphs to \mathbf{N} , and ask:
 - Can we reduce an instance (G,k) to $\text{poly}[\Pi(G)]$ vertices?
- Stronger data reduction if we can ensure $\Pi(G) \leq VC(G)$

Graph parameters

- **Vertex Cover Number $VC(G)$**
- Size of a smallest set S such that $G - S$ is edgeless

Graph parameters

- **Vertex Cover Number $VC(G)$**
- Size of a smallest set S such that $G - S$ is edgeless

Graph parameters

- **Vertex Cover Number $VC(G)$**

A refined parameter

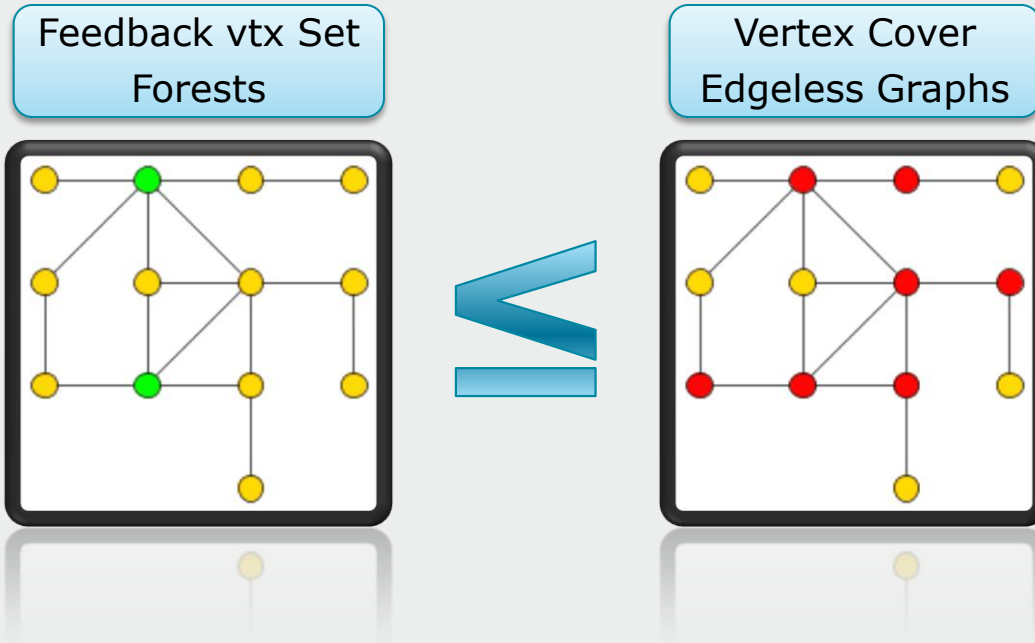

Feedback vtx Set
Forests

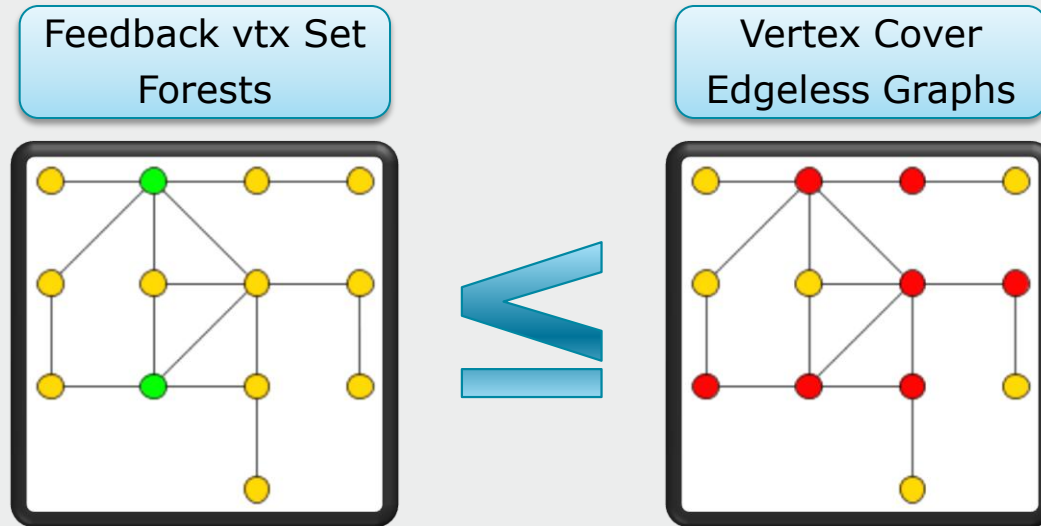

Vertex Cover
Edgeless Graphs

A refined parameter

A refined parameter

- The difference can be arbitrarily large

A refined parameter

- The difference can be arbitrarily large
- The feedback vertex number is a **refined** parameter

Our results

1. The size of an instance can efficiently be reduced to a polynomial in the size of the minimum FVS

Our results

1. The size of an instance can efficiently be reduced to a polynomial in the size of the minimum FVS

Our results

1. The size of an instance can efficiently be reduced to a polynomial in the size of the minimum FVS

- In the language of parameterized complexity:
 - Vertex Cover parameterized by the size of a feedback vertex set admits a cubic-vertex kernel

Our results

2. The **Weighted** Vertex Cover problem cannot be reduced to an instance on $\text{poly}[\text{VC}(G)]$ vertices *
 - (unless the polynomial hierarchy collapses)
 - where $\text{VC}(G)$ is the **cardinality** of a minimum vertex cover

Our results

2. The **Weighted** Vertex Cover problem cannot be reduced to an instance on $\text{poly}[\text{VC}(G)]$ vertices *
 - (unless the polynomial hierarchy collapses)
 - where $\text{VC}(G)$ is the **cardinality** of a minimum vertex cover
- Reduction to $O(\text{W-VC}(G))$ vertices *is* possible

Our results

2. The **Weighted** Vertex Cover problem cannot be reduced to an instance on $\text{poly}[\text{VC}(G)]$ vertices *
 - (unless the polynomial hierarchy collapses)
 - where $\text{VC}(G)$ is the **cardinality** of a minimum vertex cover

- Reduction to $O(W\text{-VC}(G))$ vertices *is* possible
 - where $W\text{-VC}(G)$ is the **weight** of a minimum vertex cover [Chlebík and Chlebíková, Disc Appl M 2008]

Our results

2. The **Weighted** Vertex Cover problem cannot be reduced to an instance on $\text{poly}[\text{VC}(G)]$ vertices *
 - (unless the polynomial hierarchy collapses)
 - where $\text{VC}(G)$ is the **cardinality** of a minimum vertex cover
- Reduction to $O(W\text{-VC}(G))$ vertices *is* possible
 - where $W\text{-VC}(G)$ is the **weight** of a minimum vertex cover [Chlebík and Chlebíková, Disc Appl M 2008]
- Weighted Vertex Cover can be solved in $2^{\text{VC}(G)} \text{poly}(n)$ time

Our results

2. The **Weighted** Vertex Cover problem cannot be reduced to an instance on $\text{poly}[\text{VC}(G)]$ vertices *
 - (unless the polynomial hierarchy collapses)
 - where $\text{VC}(G)$ is the **cardinality** of a minimum vertex cover
- Reduction to $O(W\text{-VC}(G))$ vertices *is* possible
 - where $W\text{-VC}(G)$ is the **weight** of a minimum vertex cover [Chlebík and Chlebíková, Disc Appl M 2008]
- Weighted Vertex Cover can be solved in $2^{\text{VC}(G)} \text{poly}(n)$ time

* This strenghtens the result as given in the paper

Sketch of the reduction rules

THE UPPER BOUNDS

Outline of the reduction algorithm

- Input: an instance (G,k) of Vertex Cover

Outline of the reduction algorithm

- Input: an instance (G,k) of Vertex Cover
- 1) Apply the Nemhauser-Trotter reduction
 - This effectively deletes vertices, so $FVS(G)$ is not increased

Outline of the reduction algorithm

- Input: an instance (G,k) of Vertex Cover
- 1) Apply the Nemhauser-Trotter reduction
 - This effectively deletes vertices, so $FVS(G)$ is not increased
- 2) Compute a 2-approximate Feedback Vertex Set X
 - [Bafna, Berman and Fujito, SIAM J Disc M 1999]

Outline of the reduction algorithm

- Input: an instance (G, k) of Vertex Cover
 - 1) Apply the Nemhauser-Trotter reduction
 - This effectively deletes vertices, so $FVS(G)$ is not increased
 - 2) Compute a 2-approximate Feedback Vertex Set X
 - [Bafna, Berman and Fujito, SIAM J Disc M 1999]
 - 3) Use the structure of X within G to apply reduction rules
 - When no rules apply, the instance is provably small

Change of perspective

- Instance (G,k) of Vertex Cover is equivalent to asking “Does G have an Independent Set of size $n - k$?”

Change of perspective

- Instance (G, k) of Vertex Cover is equivalent to asking “Does G have an Independent Set of size $n - k$?”
- Reduction rules are easier to formulate in Independent Set perspective
 - Interpret (G, k) as an instance $(G, n - k)$ of Independent Set
 - Apply reduction rules to obtain a small instance of Independent Set $(G', n' - k')$
 - Equivalent to the small Vertex Cover instance (G', k')

Structure of an instance: a canonical solution

- Let forest $F := G - X$
 - Maximum Independent Set (MIS) of F is poly-time computable

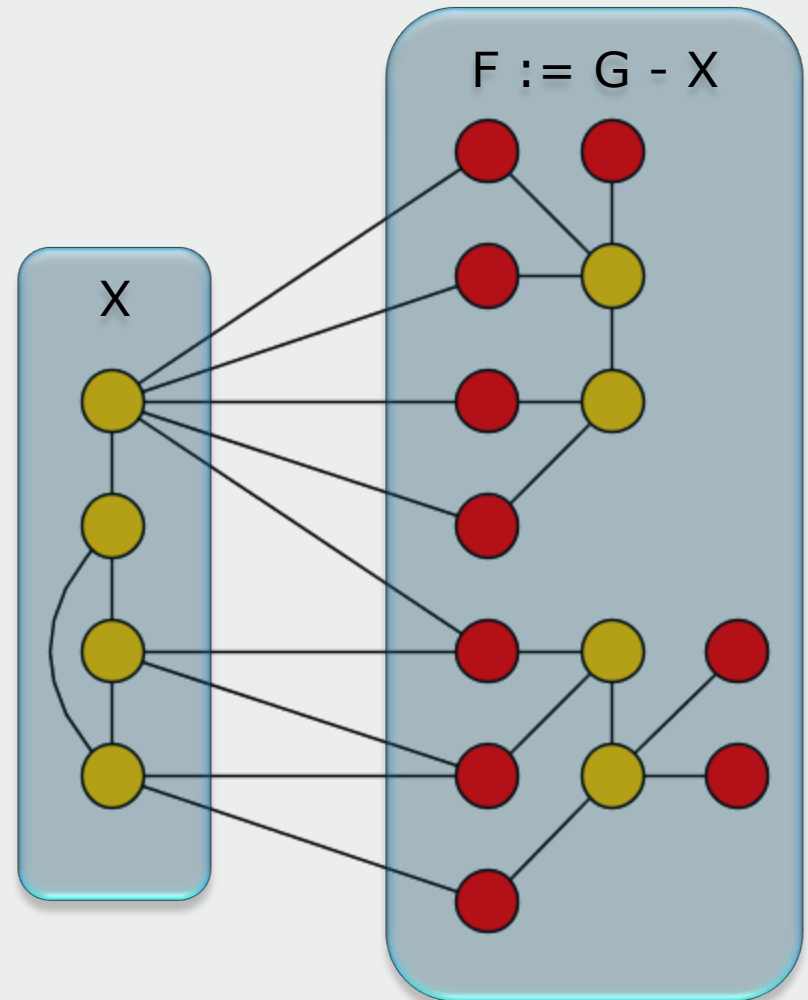

Structure of an instance: a canonical solution

- Let forest $F := G - X$
 - Maximum Independent Set (MIS) of F is poly-time computable
- Canonical solution = MIS(F)

Structure of an instance: a canonical solution

- Let forest $F := G - X$
 - Maximum Independent Set (MIS) of F is poly-time computable
- Canonical solution = MIS(F)
- Better solutions may exist using some vertices of X

Structure of an instance: a canonical solution

- Let forest $F := G - X$
 - Maximum Independent Set (MIS) of F is poly-time computable
- Canonical solution = MIS(F)
- Better solutions may exist using some vertices of X
- We can test the effect of using single vertex

Using vertices from X

- Consider using vertex v in X in an independent set

Using vertices from X

- Consider using vertex v in X in an independent set
- This IS cannot use any neighbors of v

Using vertices from X

- Consider using vertex v in X in an independent set
- This IS cannot use any neighbors of v

Using vertices from X

- Consider using vertex v in X in an independent set
- This IS cannot use any neighbors of v

Using vertices from X

- Consider using vertex v in X in an independent set
- This IS cannot use any neighbors of v
- Compare canonical solution to $\text{MIS}(F - N(v))$

Using vertices from X

- Consider using vertex v in X in an independent set
- This IS cannot use any neighbors of v
- Compare canonical solution to $\text{MIS}(F - N(v))$
- If difference $\geq |X|$:
 - Solutions containing v are not better than canonical
 - Delete v from the instance

Using vertices from X

- Consider using vertex v in X in an independent set
- This IS cannot use any neighbors of v
- Compare canonical solution to $\text{MIS}(F - N(v))$
- If difference $\geq |X|$:
 - Solutions containing v are not better than canonical
 - Delete v from the instance

Using pairs of vertices from X

- Different situation

Using pairs of vertices from X

- Different situation

Using pairs of vertices from X

- Different situation
- No single vertex triggers the reduction rule

Using pairs of vertices from X

- Different situation
- No single vertex triggers the reduction rule

Using pairs of vertices from X

- Different situation
- No single vertex triggers the reduction rule

Using pairs of vertices from X

- Consider using $\{u,v\}$ from X in the independent set
 - Impossible if $\{u,v\}$ adjacent

Using pairs of vertices from X

- Consider using $\{u,v\}$ from X in the independent set
 - Impossible if $\{u,v\}$ adjacent

Using pairs of vertices from X

- Consider using $\{u,v\}$ from X in the independent set
 - Impossible if $\{u,v\}$ adjacent
- Compare canonical solution to $\text{MIS}(F - N(u,v))$

Using pairs of vertices from X

- Consider using $\{u,v\}$ from X in the independent set
 - Impossible if $\{u,v\}$ adjacent
- Compare canonical solution to $MIS(F - N(u,v))$
- If difference $\geq |X|$:
 - Solutions containing $\{u,v\}$ are not better than canonical

Using pairs of vertices from X

- Consider using $\{u,v\}$ from X in the independent set
 - Impossible if $\{u,v\}$ adjacent
- Compare canonical solution to $\text{MIS}(F - N(u,v))$
- If difference $\geq |X|$:
 - Solutions containing $\{u,v\}$ are not better than canonical
 - Exists optimal solution which does not use both

Using pairs of vertices from X

- Consider using $\{u,v\}$ from X in the independent set
 - Impossible if $\{u,v\}$ adjacent
- Compare canonical solution to $\text{MIS}(F - N(u,v))$
- If difference $\geq |X|$:
 - Solutions containing $\{u,v\}$ are not better than canonical
 - Exists optimal solution which does not use both
 - Add edge $\{u,v\}$

Using pairs of vertices from X

- Consider using $\{u,v\}$ from X in the independent set
 - Impossible if $\{u,v\}$ adjacent
- Compare canonical solution to $MIS(F - N(u,v))$
- If difference $\geq |X|$:
 - Solutions containing $\{u,v\}$ are not better than canonical
 - Exists optimal solution which does not use both
 - Add edge $\{u,v\}$

Deleting trees from F: An example

- Consider this tree T in forest F

Deleting trees from F: An example

- Consider this tree T in forest F

Deleting trees from F: An example

- Consider this tree T in forest F
- **Any** independent set in X can be augmented with $\text{MIS}(T)$ vertices from T

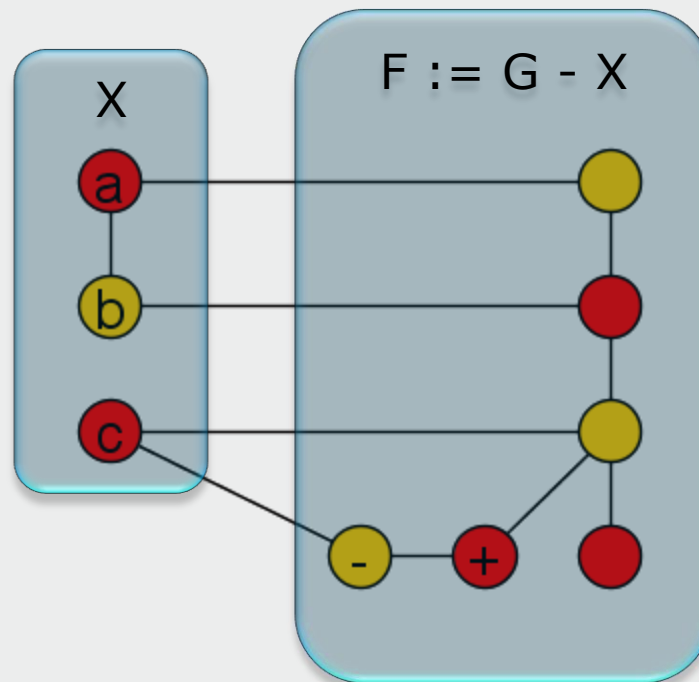

Deleting trees from F: An example

- Consider this tree T in forest F
- **Any** independent set in X can be augmented with $\text{MIS}(T)$ vertices from T

Deleting trees from F: An example

- Consider this tree T in forest F
- **Any** independent set in X can be augmented with $\text{MIS}(T)$ vertices from T

Deleting trees from F: An example

- Consider this tree T in forest F
- **Any** independent set in X can be augmented with $\text{MIS}(T)$ vertices from T

Deleting trees from F: An example

- Consider this tree T in forest F
- **Any** independent set in X can be augmented with $\text{MIS}(T)$ vertices from T
- Delete T , decrease k by $\text{MIS}(T)$

Deleting trees from F: An example

- Consider this tree T in forest F
- **Any** independent set in X can be augmented with $\text{MIS}(T)$ vertices from T
- Delete T , decrease k by $\text{MIS}(T)$

Deleting trees from F: the rule

- If there is a tree T in the forest F , such that:
 - for all non-adjacent pairs $\{u,v\}$ in X :
 $MIS(T) = MIS(T - N(u,v))$
- Then delete T from the instance, decrease k by $MIS(T)$
- Justified by the following lemma:
 - If there is an independent set $X' \subseteq X$ such that
 $MIS(T) > MIS(T - N(X'))$
 - then there is such a set of size at most 2

Overview of the reduction process

- Two more rules to simplify the trees in F
- Effect of the rules:
 - For each vertex v in X , the amount you have to “pay” in F for using v is at most $|X|$
 - Similar for pairs of vertices in X
 - But for each tree, some pair makes you pay in that tree

Overview of the reduction process

- Two more rules to simplify the trees in F
- Effect of the rules:
 - For each vertex v in X , the amount you have to “pay” in F for using v is at most $|X|$
 - Similar for pairs of vertices in X
 - But for each tree, some pair makes you pay in that tree
- Long proof shows that $|F|$ is $O(|X|^3)$ after reduction
 - Size of vertex set is $|X| + O(|X|^3)$

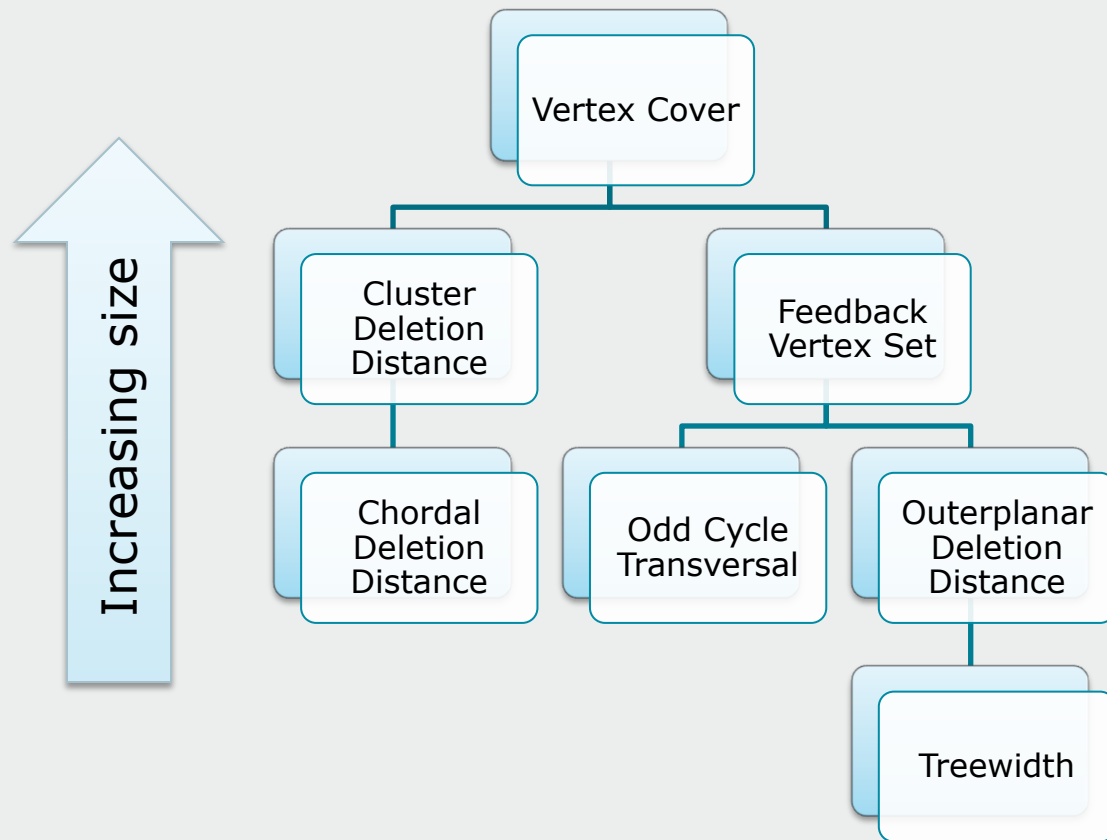

CONCLUSION AND DISCUSSION
