Problem #46

\textit{Originator: Deepak Kapur}  
\textit{Date: December 1991}

\textit{Summary: For which equational theories is ground reducibility of extended rewriting decidable?}

Ground reducibility of extended rewrite systems, modulo congruence, like associativity and commutativity (AC), is undecidable [KNZ87]. For left-linear AC systems, on the other hand, it is decidable [JK89]. What can be said more generally about restrictions on extended rewriting that give decidability? This problem is related to Problem #25.

\textbf{Remark}

Progress has been made in [KR94], where it is proven that ground reducibility remains undecidable when a single non-constant function symbol is associative.
