Lab session exercise:

1. Describe the different ways of performing an XSS attack. Select a target and the way you will attack it. Give a detailed description of how you would carry out the attack you chose. In this description you should make clear:

   - The goal of the attack
   - The target (the vulnerability your exploiting and the victim)
   - The assumptions you've made for your attack; what conditions need to be satisfied for the attack to be successful
   - The steps of your attack, including the actions of the attacker and the victim;
   - The (pseudo) code you use for your attack
