## Some facts

- a 4 by 4 Franklin Magic square does not exist
- Franklin produced some 8 by 8 and some 16 by 16 Franklin squares ( $\pm 1750$ )
- web sites of magic squares display Franklin Magic squares of order 8 and 16, even 32
- constructing squares of order  $8k$  is not so difficult
- March 22, 2007: HYPE in the Netherlands  
high school students Hoekstra, Schulte, Alkema construct an ALMOST-FRANKLIN-MAGIC square of order 12 (Dec 14, 2006)

## Questions

- do there exist Franklin Magic squares of order 12, 20, 28, . . . ?
- can a brute-force search by computer find such square?
- or is there some sophisticated way to construct these squares?

Answers: Yes and No

RED has magic sum (435)

used 2x2 magic subsquare property, plus magic row sum

Let  $P = \{1, 3, 5\}$ ,  $Q = \{2, 4, 6\}$ ,  $R = \{7, 9, 11\}$ ,  $S = \{8, 10, 12\}$ ,

a Franklin Magic square  $M$  of order 12 is a square with

1. entries  $1, 2, \dots, 144$ ;
2. each two by two sub-square  $\begin{bmatrix} M_{i,j} & M_{i,j+1} \\ M_{i+1,j} & M_{i+1,j+1} \end{bmatrix}$  has sum 290;
3. in row (column) 1, entries in first half ( $P + Q$ ) add up to 435;
4. in row (column) 1, entries in second half ( $R + S$ ) add up to 435;
5. in row (column) 1, entries in first half odd positions plus entries in second half of even positions ( $P + S$ ) add up to 435;

Note:

in row 1, entries in  $P$  and entries in  $R$  have the same sum

Let  $P = \{1, 3, 5\}$ ,  $Q = \{2, 4, 6\}$ ,  $R = \{7, 9, 11\}$ ,  $S = \{8, 10, 12\}$ ,

a Franklin Magic square  $M$  of order 12 remains Franklin Magic even

1. reflected along diagonal
2. reflected along horizontal axis of symmetry
3. reflected along vertical axis of symmetry
4. interchanging columns 1, 3, 5 (similar for  $Q, R, S$ );
5. interchanging columns in  $P$  with those in  $R$  (similar for  $Q$  and  $S$ );
6. applying above tricks to rows
