SOLUTIONS TO SELECTED EXERCISES

Chapter 1

1.3 $\lambda z. z(\lambda z. y) =_{\alpha} \lambda x. (z(\lambda z. y))^{z \rightarrow x}$, because $x \notin FV(z. (\lambda z. y))$ and x is not a binding variable in $z(\lambda z. y)$.

Since $\lambda x. (z(\lambda z. y))^{z \rightarrow x} \equiv \lambda x. x(\lambda z. y)$, by symmetry of $=_{\alpha}$, it follows that $\lambda x. x(\lambda z. y) =_{\alpha} \lambda z. z(\lambda z. y)$.

1.16 (a) Since M has a β -normal form, there is an L in β -nf such that $M =_{\beta} L$. By CR there is an N such that $M \rightarrow_{\beta} N$ and $L \rightarrow_{\beta} N$. The latter and Lemma 1.9.2 imply that $L \equiv N$, hence $M \rightarrow_{\beta} L$.

From $M \rightarrow_{\beta} M_i$ and $M \rightarrow_{\beta} L$ follows $M_i =_{\beta} L$. So, M_i has a β -normal form, since L is in β -nf.

1.16 (b) On the one hand, $(\lambda u. v)\Omega \rightarrow_{\beta} v$ (take the full term as the redex) and v is in β -nf, so $(\lambda u. v)\Omega$ has a β -normal form.

On the other hand, $(\lambda u. v)\Omega \rightarrow_{\beta} (\lambda u. v)\Omega \rightarrow_{\beta} (\lambda u. v)\Omega \dots$ (take Ω as the redex).

Chapter 2

2.5 (a) Since x has two arguments in the subterm $x(\lambda z. y)y$, we start with $x : \sigma \rightarrow \tau \rightarrow \rho$. Then $\lambda z. y : \sigma$ and $y : \tau$.

Take $z : \zeta$, then $\lambda z : \zeta. y : \zeta \rightarrow \tau \equiv \sigma$. Hence $x : (\zeta \rightarrow \tau) \rightarrow \tau \rightarrow \rho$ and we get the legal term $\lambda x : (\zeta \rightarrow \tau) \rightarrow \tau \rightarrow \rho. \lambda y : \tau. x(\lambda z : \zeta. y)y$ of type $((\zeta \rightarrow \tau) \rightarrow \tau \rightarrow \rho) \rightarrow \tau \rightarrow \rho$.

2.5 (b) Again, take $x : \sigma \rightarrow \tau \rightarrow \rho$. Then $\lambda z. x : \sigma$ and $y : \tau$.

Take $z : \zeta$, then $\lambda z : \zeta. x : \zeta \rightarrow \sigma \rightarrow \tau \rightarrow \rho \equiv \sigma$, which is impossible. Hence, $\lambda x. \lambda y. x(\lambda z. x)y$ is not typable.

2.10 (d) Consider the subterm $y(xz)z$. Since $x : \alpha \rightarrow \beta$, we must have $z : \alpha$ and hence $xz : \beta$. So, $y : \beta \rightarrow \alpha \rightarrow \gamma$ for some type γ . Now we can derive:

(a)	$y : \beta \rightarrow \alpha \rightarrow \gamma$	
(b)	$z : \alpha$	
(c)	$x : \alpha \rightarrow \beta$	
(1)	$xz : \beta$	(<i>appl</i>) on (c) and (b)
(2)	$y(xz) : \alpha \rightarrow \gamma$	(<i>appl</i>) on (a) and (1)
(3)	$y(xz)z : \gamma$	(<i>appl</i>) on (2) and (b)

$$(4) \quad \left| \left| \lambda x : \alpha \rightarrow \beta . y(xz)z : (\alpha \rightarrow \beta) \rightarrow \gamma \quad (\text{abst}) \text{ on (3)} \right. \right.$$

Hence, $\lambda x : \alpha \rightarrow \beta . y(xz)z$ is legal, since we have found a context Γ (namely $y : \beta \rightarrow \alpha \rightarrow \gamma, z : \alpha$) and a type τ (namely $(\alpha \rightarrow \beta) \rightarrow \gamma$) such that $\Gamma \vdash \lambda x : \alpha \rightarrow \beta . y(xz)z : \tau$.

2.12 (a)

$$\begin{array}{|l} \hline x : (\alpha \rightarrow \beta) \rightarrow \alpha \\ \hline \begin{array}{|l} y : \alpha \rightarrow \alpha \rightarrow \beta \\ \hline \begin{array}{|l} z : \alpha \\ \hline yz : \alpha \rightarrow \beta \\ yzz : \beta \\ \hline \lambda z : \alpha . yzz : \alpha \rightarrow \beta \\ x(\lambda z : \alpha . yzz) : \alpha \quad (*) \\ \hline \lambda y : \alpha \rightarrow \alpha \rightarrow \beta . x(\lambda z : \alpha . yzz) : (\alpha \rightarrow \alpha \rightarrow \beta) \rightarrow \alpha \\ \hline \lambda x : (\alpha \rightarrow \beta) \rightarrow \alpha . \lambda y : \alpha \rightarrow \alpha \rightarrow \beta . x(\lambda z : \alpha . yzz) : \\ ((\alpha \rightarrow \beta) \rightarrow \alpha) \rightarrow (\alpha \rightarrow \alpha \rightarrow \beta) \rightarrow \alpha \end{array} \end{array} \end{array}$$

2.12 (b)

$$\begin{array}{|l} \hline x : (\alpha \rightarrow \beta) \rightarrow \alpha \\ \hline \begin{array}{|l} y : \alpha \rightarrow \alpha \rightarrow \beta \\ \hline x(\lambda z : \alpha . yzz) : \alpha \quad (\text{see } (*) \text{ in part (a)}) \\ y(x(\lambda z : \alpha . yzz)) : \alpha \rightarrow \beta \\ y(x(\lambda z : \alpha . yzz))(x(\lambda z : \alpha . yzz)) : \beta \\ \hline \lambda y : \alpha \rightarrow \alpha \rightarrow \beta . y(x(\lambda z : \alpha . yzz))(x(\lambda z : \alpha . yzz)) : \\ (\alpha \rightarrow \alpha \rightarrow \beta) \rightarrow \beta \\ \hline \lambda x : (\alpha \rightarrow \beta) \rightarrow \alpha . \lambda y : \alpha \rightarrow \alpha \rightarrow \beta . y(---)(---) : \\ ((\alpha \rightarrow \beta) \rightarrow \alpha) \rightarrow (\alpha \rightarrow \alpha \rightarrow \beta) \rightarrow \beta \end{array} \end{array}$$

2.18 Proof of the Compatibility cases of Lemma 2.11.5.

Induction: Subject Reduction holds for the assumption $M \rightarrow_{\beta} M'$; that is: for all Γ and σ , if $\Gamma \vdash M : \sigma$ and $M \rightarrow_{\beta} M'$, then $\Gamma \vdash M' : \sigma$.

(2.1) Case 1: $\Gamma \vdash MK : \rho$ and $MK \rightarrow_{\beta} M'K$. Then by Lemma 2.10.7(2)

there is a type σ such that $\Gamma \vdash M : \sigma \rightarrow \rho$ and $\Gamma \vdash K : \sigma$. By induction: $\Gamma \vdash M' : \sigma \rightarrow \rho$. Hence $\Gamma \vdash M'K : \rho$.

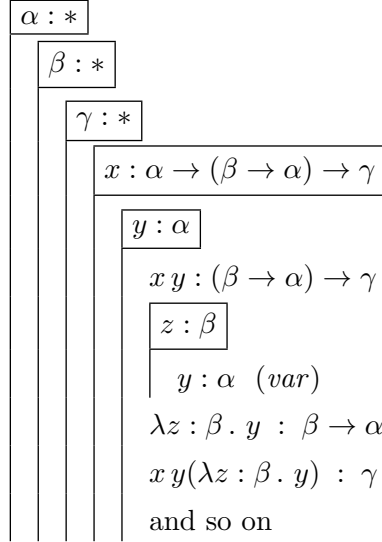

(2.2) Case 2: $\Gamma \vdash KM : \rho$ and $KM \rightarrow_{\beta} K'M$. Then by Lemma 2.10.7 (2) there is a type σ such that $\Gamma \vdash K : \sigma \rightarrow \rho$ and $\Gamma \vdash M : \sigma$. By induction: $\Gamma \vdash M' : \sigma$. Hence $\Gamma \vdash KM' : \rho$.

(2.3) Case 3: $\Gamma \vdash \lambda x : \tau. M : \rho$. Then by Lemma 2.10.7 (3) there is a type σ such that $\Gamma, x : \tau \vdash M : \sigma$ and $\rho \equiv \tau \rightarrow \sigma$. By induction: $\Gamma, x : \tau \vdash M' : \sigma$. Hence $\Gamma \vdash \lambda x : \tau. M' : \tau \rightarrow \sigma$, so $\Gamma \vdash \lambda x : \tau. M' : \rho$.

Chapter 3

3.6 (b)

3.6 (c)

So an inhabitant is:

$$- \lambda \alpha : *. \lambda \beta : *. \lambda \gamma : *. \lambda x : \alpha \rightarrow (\beta \rightarrow \alpha) \rightarrow \gamma. \lambda y : \alpha. x y (\lambda z : \beta. y).$$

3.13 (b) $Mult \equiv \lambda m, n : Nat. \lambda \alpha : *. \lambda f : \alpha \rightarrow \alpha. \lambda x : Nat. m \alpha (n \alpha f) x$.

Example:

$$Mult \ One \ Two \rightarrow_{\beta} \lambda \alpha : *. \lambda f : \alpha \rightarrow \alpha. \lambda x : Nat. \ One \ \alpha (Two \ \alpha \ f) x.$$

Now we have:

- (1) $Two \ \alpha \ f \equiv (\lambda \alpha : *. \lambda f : \alpha \rightarrow \alpha. \lambda x : \alpha. f(f x)) \alpha \ f \rightarrow_{\beta} \lambda x : \alpha. f(f x)$,
- (2) $One \ \alpha (Two \ \alpha \ f) \rightarrow_{\beta} (\lambda \alpha : *. \lambda f : \alpha \rightarrow \alpha. \lambda x : \alpha. f x) \alpha (\lambda x : \alpha. f(f x)) \rightarrow_{\beta} \lambda x : \alpha. (\lambda x : \alpha. f(f x)) x \rightarrow_{\beta} \lambda x : \alpha. f(f x)$,
- (3) $One \ \alpha (Two \ \alpha \ f) x \rightarrow_{\beta} f(f x)$.

So $Mult \ One \ Two \rightarrow_{\beta} \lambda \alpha : *. \lambda f : \alpha \rightarrow \alpha. \lambda x : Nat. f(f x) \equiv Two$.

3.17 We try to find a $\lambda 2$ -term M such that $(\lambda u : Nat. M) Zero \rightarrow_{\beta} True$ and $(\lambda u : Nat. M) n \rightarrow_{\beta} False$ for polymorphic Church numerals n that are not $Zero$.

In the if–then–else term of Exercise 1.14, what we take for x in $x u v$ decides about the answer. Here the decision follows from what we take for u . Therefore we substitute $u X Y$ for M and try to find X and Y . We now have:

$$(\lambda u : Nat. u X Y) Zero \rightarrow_{\beta} Zero X Y, \text{ which should reduce to } True,$$

and for other numbers (for example One):

$$(\lambda u : Nat. u X Y) One \rightarrow_{\beta} One X Y, \text{ which should reduce to } False.$$

Now both $Zero$ and One have not two, but three abstractions in their definitions, so $u X Y$ is not good enough. We should add one more argument to u .

Since *Zero* and *One* start with $\lambda\alpha : * . \dots$ and end in x or fx , both of type α , and since the answer must always be a Boolean (*True* or *False*), it is a good guess to take *Bool* for α .

So instead of $u XY$ we try $u \text{Bool } XY$ and we try to find X and Y such that $\text{Zero Bool } XY \rightarrow_{\beta} \text{True}$ and $\text{One Bool } XY \rightarrow_{\beta} \text{False}$. Now we can easily see that $\text{Zero Bool } XY \rightarrow_{\beta} Y$ and $\text{One Bool } XY \rightarrow_{\beta} XY$. Hence, we can take *True* for Y and the function $\lambda x : \text{Bool} . \text{False}$ for X , since then $XY \rightarrow_{\beta} \text{False}$.

Altogether, we get $\text{Iszero} \equiv \lambda u : \text{Nat} . u \text{Bool } (\lambda x : \text{Bool} . \text{False}) \text{True}$, and it is not hard to verify that this works not only for *Zero* and *One*, but also for the other polymorphic Church numerals.

4.4 (a)

(a)	$\alpha : *$	
(b)	$\beta : * \rightarrow *$	
(1)	$\beta \alpha : *$	<i>(appl)</i> on (b) and (a)
(2)	$\beta(\beta \alpha) : *$	<i>(appl)</i> on (b) and (1)

4.5

(a)	$\alpha : *$	
(b)	$x : \alpha$	
(c)	$y : \alpha$	
(1)	$x : \alpha$	<i>(weak)</i> on (b)
(2)	$\lambda y : \alpha . x : \alpha \rightarrow \alpha$	<i>(abst)</i> on (1)
(d)	$\beta : *$	
(3)	$\beta \rightarrow \beta : *$	<i>(form)</i> on (d) and (d)
(4)	$\lambda \beta : * . \beta \rightarrow \beta : * \rightarrow *$	<i>(abst)</i> on (3)
(5)	$(\lambda \beta : * . \beta \rightarrow \beta) \alpha : *$	<i>(appl)</i> on (4) and (a)
(6)	$\lambda y : \alpha . x : (\lambda \beta : * . \beta \rightarrow \beta) \alpha$	<i>(conv)</i> on (2) and (5)

4.6 (b) Proof by induction on the structure of the derivation tree of the judgement $\Gamma \vdash M \rightarrow \square : N$.

The last step in the derivation can only have been *(weak)*, *(form)* or *(cond)*.
 Case 1: *(weak)*. First premiss must have been of the form $\Gamma' \vdash M \rightarrow \square : N$.
 By induction this is not derivable.

Case 2: *(form)*. Second premiss must have been $\Gamma \vdash \square : N$. This is not derivable by Exercise 4.6 (a).

Case 3: *(cond)*. First premiss must have been $\Gamma \vdash M \rightarrow \square : L$. By induction this is not derivable.

Final conclusion: $\Gamma \vdash M \rightarrow \square : N$ is not derivable.

Chapter 5

5.4

The kind $* \rightarrow *$ is actually $\Pi x : * . *$, which can only be constructed by means of *(form)*. The first premiss then requires $\Gamma \vdash * : *$.

However, $\Gamma \vdash * : B$ is impossible for any B not being \square (which can be shown

by induction on the length of the assumed derivation of such a judgement, by inspection of the derivation rules given in Figure 5.1). As a consequence, $\Gamma \vdash * : *$ is impossible, so $* \rightarrow * : \square$ cannot be derived in any Γ .

A similar observation holds for all other kinds, except $*$ itself.

5.9 (b) Proof in natural deduction:

(a)	$\forall_{x \in S}(P(x) \Rightarrow Q(x))$	
(b)	$\forall_{y \in S}(P(y))$	
(c)	$z \in S$	
(1)	$P(z) \Rightarrow Q(z)$	\forall -elimination on (a) and (c)
(2)	$P(z)$	\forall -elimination on (b) and (c)
(3)	$Q(z)$	\Rightarrow -elimination on (1) and (2)
(4)	$\forall_{z \in S}(Q(z))$	\forall -introduction on (3)
(5)	$(\forall_{y \in S}(P(y))) \Rightarrow (\forall_{z \in S}(Q(z)))$	\Rightarrow -introduction on (4)
(6)	$(\forall_{x \in S}(P(x) \Rightarrow Q(x))) \Rightarrow$ $((\forall_{y \in S}(P(y))) \Rightarrow (\forall_{z \in S}(Q(z))))$	\Rightarrow -introduction on (5)

Proof by a λ P-derivation:

$S : *$
$P, Q : S \rightarrow *$
$u : \Pi x : S. (P x \rightarrow Q x)$
$v : \Pi y : S. P y$
$z : S$
$u z : P z \rightarrow Q z$
$v z : P z$
$u z (v z) : Q z$
$\lambda z : S. u z (v z) : \Pi z : S. Q z$
$\lambda v : (\Pi y : S. P y). \lambda z : S. u z (v z) : (\Pi y : S. P y) \rightarrow \Pi z : S. Q z$
$\lambda u : (\Pi x : S. (P x \rightarrow Q x)). \lambda v : (\Pi y : S. P y). \lambda z : S. u z (v z) :$ $(\Pi x : S. (P x \rightarrow Q x)) \rightarrow (\Pi y : S. P y) \rightarrow \Pi z : S. Q z$

5.11 Note that $R(g(gx))(gx)$ can be obtained from the second assumption if

we have $Q(g(gx))(f(gx))$, which in its turn follows from the first assumption and $Q(gx)(f(f(gx)))$. The last-mentioned expression is a consequence of the third assumption, as can be seen in the following derivation:

$$\begin{array}{l}
 \boxed{S : *} \\
 \boxed{Q, R : S \rightarrow S \rightarrow *} \\
 \boxed{f, g : S \rightarrow S} \\
 \boxed{u : \Pi x, y : S. Qx(fy) \rightarrow Q(gx)y} \\
 \boxed{v : \Pi x, y : S. Qx(fy) \rightarrow Rxy} \\
 \boxed{w : \Pi x : S. Qx(f(fx))} \\
 \boxed{x : S} \\
 gx : S \\
 w(gx) : Q(gx)(f(f(gx))) \\
 f(gx) : S \\
 u(gx)(f(gx)) : Q(gx)(f(f(gx))) \rightarrow Q(g(gx))(f(gx)) \\
 u(gx)(f(gx))(w(gx)) : Q(g(gx))(f(gx)) \\
 g(gx) : S \\
 v(g(gx))(gx) : Q(g(gx))(f(gx)) \rightarrow R(g(gx))(gx) \\
 v(g(gx))(gx)(u(gx)(f(gx))(w(gx))) : R(g(gx))(gx) \\
 \lambda x : S. v(g(gx))(gx)(u(gx)(f(gx))(w(gx))) : \\
 \Pi x : S. R(g(gx))(gx)
 \end{array}$$

Chapter 6

6.4 (a) Determine the (s_1, s_2) -combination of each Π -type occurring in M :

Π -type	(s_1, s_2)	because
$S \rightarrow *$	$(*, \square)$	
$S \rightarrow S \rightarrow *$	$(*, \square)$	$S \rightarrow * : \square$
\perp	$(\square, *)$	
$Qyx \rightarrow \perp$	$(*, *)$	$\perp : *$
$Qxy \rightarrow Qyx \rightarrow \perp$	$(*, *)$	$Qyx \rightarrow \perp : *$
$Qzz \rightarrow \perp$	$(*, *)$	$\perp : *$
$\Pi z : S. (Qzz \rightarrow \perp)$	$(*, *)$	
$\Pi y : S. (Qxy \rightarrow Qyx \rightarrow \perp)$	$(*, *)$	
$\Pi x, y : S. (Qxy \rightarrow Qyx \rightarrow \perp)$	$(*, *)$	
$(\Pi x, y : S. \dots) \rightarrow (\Pi z : S. \dots)$	$(*, *)$	

So the smallest system to which this judgement belongs is $\lambda P2$.

6.4 (c) M can be interpreted as the proposition

$$\forall_{x,y \in S} (Q(x,y) \Rightarrow \neg Q(y,x)) \Rightarrow \forall_{z \in S} (\neg Q(z,z)).$$

The inhabiting term describes, in an abstract manner, the steps that can be made to achieve a natural deduction proof of this proposition, namely:

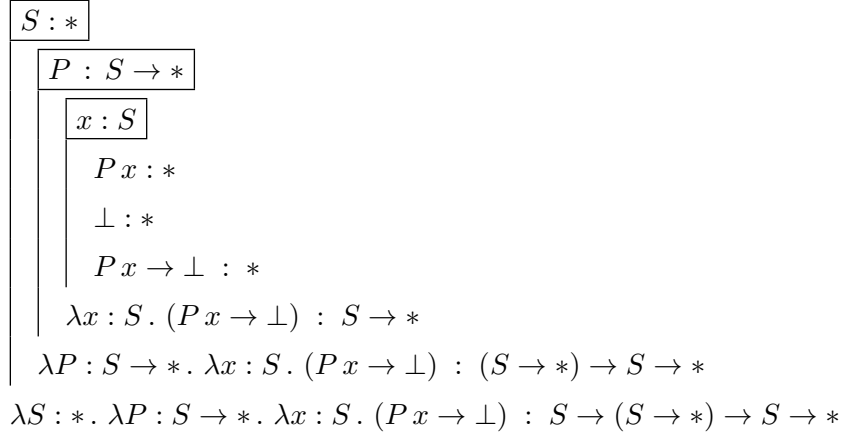

$$\begin{array}{l}
 \boxed{\forall_{x,y \in S} (Q(x,y) \Rightarrow \neg Q(y,x))} \\
 \left| \begin{array}{l}
 \boxed{z \in S} \\
 \left| \begin{array}{l}
 \boxed{Q(z,z)} \\
 \forall_{y \in S} (Q(z,y) \Rightarrow \neg Q(y,z)) \text{ } (\forall\text{-elim}) \\
 Q(z,z) \Rightarrow \neg Q(z,z) \text{ } (\forall\text{-elim}) \\
 \neg Q(z,z) \text{ } (\Rightarrow\text{-elim}) \\
 \textit{contradiction (i.e. } \perp \text{)} \text{ } (\Rightarrow\text{-elim}) \\
 \neg Q(z,z) \text{ } (\neg\text{-intro})
 \end{array}
 \end{array}
 \right. \\
 \forall_{z \in S} (\neg Q(z,z)) \text{ } (\forall\text{-intro}) \\
 (\forall_{x,y \in S} (Q(x,y) \Rightarrow \neg Q(y,x)) \Rightarrow \forall_{z \in S} (\neg Q(z,z))) \text{ } (\Rightarrow\text{-intro})
 \end{array}$$

For example, the subterm uz of the inhabiting term describes how to apply $(\forall\text{-elim})$ on $\forall_{x,y \in S} (Q(x,y) \Rightarrow \neg Q(y,x))$ (inhabitant: u) and $z \in S$, in order to obtain $\forall_{y \in S} (Q(z,y) \Rightarrow \neg Q(y,z))$.

6.6 (a) The smallest system is λC itself, since, for example:

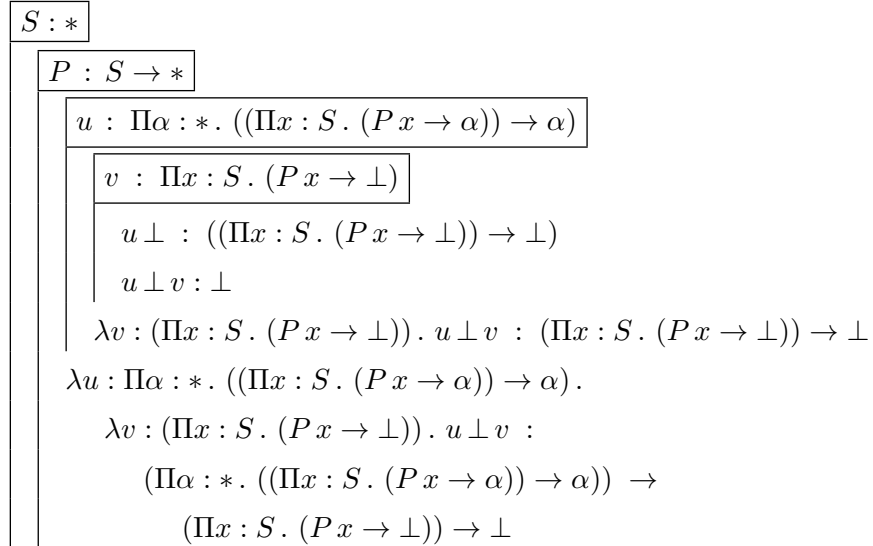

- \perp needs $(\square, *)$,
- $\lambda x : S . (P x \rightarrow \perp)$ needs $(*, \square)$, and
- $\lambda P : S \rightarrow * . \lambda x : S . (P x \rightarrow \perp)$ needs (\square, \square) .

6.6 (b)

6.6 (c) M can be interpreted as the function that maps a set S and a predicate P on S to the ‘complement’ of P , that is: the predicate that is only true for x in S if P does *not* hold for x .

6.8 (a)

6.8 (b) System $\lambda 2$.

6.8 (c) N can be interpreted as the logical proposition:

$$\exists_{x \in S}(P(x)) \Rightarrow \neg \forall_{x \in S}(\neg P(x)).$$

Chapter 7

7.1 (d) Proof in natural deduction:

$$\begin{array}{l}
 \boxed{\neg(A \Rightarrow B)} \\
 \left| \begin{array}{l}
 \boxed{B} \\
 \left| \begin{array}{l}
 \boxed{A} \\
 \left| B \text{ (repeat)} \\
 A \Rightarrow B \text{ (}\Rightarrow\text{-intro)} \\
 \perp \text{ (}\neg\text{-elim)} \\
 \neg B \text{ (}\neg\text{-intro)}
 \end{array}
 \end{array}
 \right. \\
 \neg(A \Rightarrow B) \Rightarrow \neg B \text{ (}\Rightarrow\text{-intro)}
 \end{array}$$

A corresponding derivation is the following (for the ‘condensed’ first flag, see Notation 11.5.1):

$$\begin{array}{l}
 \boxed{A, B : *} \\
 \left| \begin{array}{l}
 \boxed{x : \neg(A \rightarrow B)} \\
 \left| \begin{array}{l}
 \boxed{y : B} \\
 \left| \begin{array}{l}
 \boxed{z : A} \text{ (see Exercise 7.1 (a) for this flag and the next two lines)} \\
 y : B \text{ (weak)} \\
 \lambda z : A. y : A \rightarrow B \text{ (abst)} \\
 x(\lambda z : A. y) : \perp \text{ (appl)} \\
 \lambda y : B. x(\lambda z : A. y) : \neg B \text{ (abst)}
 \end{array}
 \end{array}
 \right. \\
 \lambda x : \neg(A \rightarrow B). \lambda y : B. x(\lambda z : A. y) : \neg(A \rightarrow B) \rightarrow \neg B \text{ (abst)}
 \end{array}
 \end{array}$$

7.2 (a)

$$\boxed{\iota_{DN} : \prod \beta : *. \neg \neg \beta \rightarrow \beta}$$

7.4 (a)

$A, B : *$
$x : \Pi C : *. (A \rightarrow B \rightarrow C) \rightarrow C \ (\equiv A \wedge B)$
$x A : (A \rightarrow B \rightarrow A) \rightarrow A$
$\lambda u : A. \lambda v : B. u : A \rightarrow B \rightarrow A \ (\text{cf. Exercise 7.1 (a)})$
$x A(\lambda u : A. \lambda v : B. u) : A$

7.5 (a)

$\iota_{DN} : \Pi \beta : *. \neg \neg \beta \rightarrow \beta$
$A, B : *$
$x : \neg(A \rightarrow B)$
$y : \neg A$
$\lambda u : \neg A. \lambda v : A. u v B : \neg A \rightarrow (A \rightarrow B)$ (see Exercise 7.1 (b))
$(\lambda u : \neg A. \lambda v : A. u v B)y : A \rightarrow B \ (\text{appl})$
$\lambda v : A. y v B : A \rightarrow B \ (\text{Subject Reduction})$
$x(\lambda v : A. y v B) : \perp \ (\text{appl})$
$\lambda y : \neg A. x(\lambda v : A. y v B) : \neg \neg A \ (\text{abst})$
$\iota_{DN} A : \neg \neg A \rightarrow A \ (\text{appl})$
$\iota_{DN} A(\lambda y : \neg A. x(\lambda v : A. y v B)) : A \ (\text{appl}) \ (*)$
$\lambda x : \neg(A \rightarrow B). \dots : \neg(A \rightarrow B) \rightarrow A \ (\text{abst})$

7.5 (b)

$x : \neg(A \rightarrow B)$
$\lambda y : B. x(\lambda z : A. y) : \neg B \ (\text{see Exercise 7.1 (d)})$
$\lambda C : *. \lambda z : A \rightarrow \neg B \rightarrow C.$
$z(\iota_{DN} A(\lambda y : \neg A. x(\lambda v : A. y v B)))(\lambda y : B. x(\lambda z : A. y))$ (see (*) in the solution to Exercise 7.5 (a); see also line (4) in the derivation in Section 7.2) :
$\Pi C : *. (A \rightarrow \neg B \rightarrow C) \rightarrow C \ (\equiv A \wedge \neg B)$

$$\left| \left| \lambda x : \neg(A \rightarrow B). \dots : \neg(A \rightarrow B) \rightarrow (A \wedge \neg B) \text{ (} abst \text{)} \right. \right.$$
7.11 (a)

$$\begin{array}{l} \boxed{S : *} \\ \boxed{P, Q : S \rightarrow *} \\ \boxed{y : \Pi \alpha : *. ((\Pi x : S. (P x \rightarrow \alpha)) \rightarrow \alpha)} \\ \boxed{z : \Pi x : S. (P x \rightarrow Q x)} \\ \boxed{x : S} \\ y(Q x) : (\Pi y : S. (P y \rightarrow Q x)) \rightarrow Q x \end{array}$$

Note: there is a ‘new’ x involved in $y(Q x)$ (the one in the last flag). Hence, for the calculation of its type, the binding variable x in $\Pi x : S. (P x \rightarrow \alpha)$ must be renamed, in order to avoid a ‘variable clash’.

7.11 (b)

Incorrect, because z is not of type $(\Pi y : S. (P y \rightarrow Q x)) \rightarrow Q x$.

7.12 (b)

In Exercise 7.12 (a) we show that, when $P a$ is inhabited for some a in S , then we can derive $\exists x : S. P x$. In the derivation below we use a variant: since $\neg(P y)$ is inhabited (see the fifth flag), we can derive, similarly to Exercise 7.12 (a), that $\exists x : S. \neg(P x)$, which is

$$\Pi \alpha : *. ((\Pi x : S. (\neg(P x) \rightarrow \alpha)) \rightarrow \alpha).$$

See (*) in the derivation below.

$$\begin{array}{l} \boxed{S : *} \\ \boxed{P : S \rightarrow *} \\ \boxed{u : \neg \Pi \alpha : *. ((\Pi x : S. (\neg(P x) \rightarrow \alpha)) \rightarrow \alpha) \text{ [} \equiv \neg \exists x : S. \neg(P x) \text{]}} \\ \boxed{y : S} \\ \boxed{v : \neg(P y)} \\ \boxed{\alpha : *} \\ \boxed{w : \Pi x : S. (\neg(P x) \rightarrow \alpha)} \\ wy : \neg(P y) \rightarrow \alpha \\ wyv : \alpha \\ \lambda w : (\Pi x : S. (\neg(P x) \rightarrow \alpha)). wyv : \end{array}$$

Chapter 8

8.1 $m : \mathbb{N}^+, n : \mathbb{N}^+, u : \text{coprime}(m, n) \triangleright$

$$p(m, n, u) := \text{formalproof} : \exists x, y : \mathbb{Z}. (m x + n y = 1)$$

$m : \mathbb{N}^+, n : \mathbb{N}^+ \triangleright$

$$q(m, n) := \text{formalproof}_1 : \text{coprime}(m, n) \Rightarrow \text{coprime}(n, m)$$

Then: $m : \mathbb{N}^+, n : \mathbb{N}^+, u : \text{coprime}(m, n) \triangleright$

$$r(m, n, u) := p(n, m, q(m, n)u) : \exists x, y : \mathbb{Z}. (n x + m y = 1)$$

8.4 (a) Let S be a set and \cdot a binary operation on S . We call (S, \cdot) a *semigroup* if for all $x, y, z \in S$: $x \cdot (y \cdot z) = (x \cdot y) \cdot z$.

Let (S, \cdot) be a semigroup. An element e in S is called a *unit* of (S, \cdot) if, for all $x \in S$, $x \cdot e = e \cdot x = x$.

If both e_1 and e_2 are units of (S, \cdot) , then $e_1 = e_2$.

8.6 (a)

	$k, l, m : \mathbb{Z}$	
		$u : m > 0$
(1)		$\text{congruent-modulo}(k, l, m, u) := m \mid k - l : *_p$
(2)		$\text{equiv}(k, l, m, u) := \text{congruent-modulo}(k, l, m, u) : *_p$
(3)		$v := \text{formalproof}_3 : 5 > 0$
(4)		$a_4 := \text{formalproof}_4 : \text{equiv}(-3, 17, 5, v)$
(5)		$a_5 := \text{formalproof}_5 : \neg \text{equiv}(-3, -17, 5, v)$
	$k, l, m : \mathbb{Z}$	
		$u : m > 0$
(6)		$a_6(k, l, m, u) := \text{formalproof}_6 : \text{equiv}(k, l, m, u) \Rightarrow \text{equiv}(l, k, m, u)$
(7)		$a_7(k, l, m, u) := \text{formalproof}_7 :$ $\text{equiv}(k, l, m, u) \Rightarrow \exists n : \mathbb{Z}. (k = l + n m)$

8.6 (c) Line (2), (k, l, m, u) in $\text{congruent-modulo}(k, l, m, u)$. Identity instantiation.

Line (4), $(-3, 17, 5, v)$. Type conditions: $-3 : \mathbb{Z}, 17 : \mathbb{Z}, 5 : \mathbb{Z}, v : 5 > 0$.

Line (5), $(-3, -17, 5, v)$. Type conditions: $-3 : \mathbb{Z}, -17 : \mathbb{Z}, 5 : \mathbb{Z}, v : 5 > 0$.

Line (6), (k, l, m, u) in $\text{equiv}(k, l, m, u)$. Identity instantiation.

Line (6), (l, k, m, u) in $\text{equiv}(l, k, m, u)$. Type conditions: $l : \mathbb{Z}, k : \mathbb{Z}, m : \mathbb{Z},$
 $u : m > 0$.

Line (7), (k, l, m, u) in $\text{equiv}(k, l, m, u)$. Identity instantiation.

Chapter 9

9.3 $\forall x : \mathbb{R}. [x \in \{z : \mathbb{R} \mid \exists n : \mathbb{N}. (n \in \mathbb{N} \wedge z = \frac{n}{n+1})\} \Rightarrow x \leq 1] \wedge$

$\forall x : \mathbb{R}. [x < 1 \Rightarrow$

$\neg \forall y : \mathbb{R}. (y \in \{z : \mathbb{R} \mid \exists n : \mathbb{N}. (n \in \mathbb{N} \wedge z = \frac{n}{n+1})\} \Rightarrow y \leq x)]$

9.5 We only treat the expression *least-upper-bound*($S, p_6, 1$) in line (8), with instantiated list ($S, p_6, 1$) instead of the original list (V, u, s).

(1) $V \rightarrow S$. We have $V : *_s$ and $S : *_s$, so \checkmark .

(2) $u \rightarrow p_6$. Now $u : V \subseteq \mathbb{R}$, so we must have $p_6 : (V \subseteq \mathbb{R})[V := S] \equiv S \subseteq \mathbb{R}$, \checkmark .

(3) $s \rightarrow 1$. Now $s : \mathbb{R}$, so we must have $1 : \mathbb{R}[V := S, u := p_6] \equiv \mathbb{R}$, \checkmark .

9.6 (b) Arithmetic progression.

9.6 (c) $\sum_{i=0}^{100} ((\lambda x : \mathbb{N}. 2x)i) = (100 + 1) \cdot (\lambda x : \mathbb{N}. 2x)0 + \frac{1}{2} \cdot 100 \cdot (100 + 1) \cdot 2$
(In ‘words’: $0 + 2 + \dots + 200 = 101 \cdot 0 + \frac{1}{2} \cdot 100 \cdot 101 \cdot 2$, so = 10100.)

9.7 (b) $\mathcal{D}_1, \mathcal{D}_2; \emptyset \vdash * : \square?$

Conditions according to (*def*):

– $\mathcal{D}_1; \emptyset \vdash * : \square$ (see Exercise 9.7(a)).

– $\mathcal{D}_1; f : \mathbb{N} \rightarrow \mathbb{R}, d : \mathbb{R} \vdash \forall n : \mathbb{N}. (f(n+1) - f n = d) : *_p$

9.10 (a) The final judgement $\mathcal{J}_n \equiv \Delta_n; \Gamma_n \vdash M_n : N_n$ has been derived by means of (*weak*), so the last step was:

$$\frac{\Delta_n; \Gamma'_n \vdash M_n : N_n \quad \Delta_n; \Gamma'_n \vdash C : s}{\Delta_n; \Gamma_n \vdash M_n : N_n},$$

with $\Gamma_n \equiv \Gamma'_n, x : C$.

By the assumption, since $\Delta_n; \Gamma'_n \vdash M_n : N_n$ has been derived earlier than \mathcal{J}_n , we have $\Delta_n; \Gamma'_n \vdash * : \square$. Then (*weak*), again, gives:

$$\frac{\Delta_n; \Gamma'_n \vdash * : \square \quad \Delta_n; \Gamma'_n \vdash C : s}{\Delta_n; \Gamma'_n, x : C \vdash * : \square}$$

Hence, $\Delta_n; \Gamma_n \vdash * : \square$.

Chapter 10

10.2 (a)

If we define $A, B : *_p \triangleright k(A, B) := \perp : (A \Rightarrow B) \Rightarrow A$, then

$k(\perp, \perp) : (\perp \Rightarrow \perp) \Rightarrow \perp$. We have: $\lambda x : \perp. x : \perp \Rightarrow \perp$, hence

$k(\perp, \perp)(\lambda x : \perp. x) : \perp$.

So \perp is inhabited, otherwise said: a contradiction is derived.

10.2 (c) Suppose we define:

$$P : \mathbb{N} \rightarrow *_p \triangleright \text{ind-}s(P) := \forall n : \mathbb{N}. (Pn \Rightarrow P(sn)) \Rightarrow \forall n : \mathbb{N}. Pn.$$

Now define the predicate P_\perp by $\emptyset \triangleright P_\perp := \lambda n : \mathbb{N}. \perp$. Then:

$$\begin{aligned} \text{ind-}s(P_\perp) &=_{\delta} \forall n : \mathbb{N}. (P_\perp n \Rightarrow P_\perp(sn)) \Rightarrow \forall n : \mathbb{N}. P_\perp n \\ &=_{\beta} \forall n : \mathbb{N}. (\perp \Rightarrow \perp) \Rightarrow \forall n : \mathbb{N}. \perp. \end{aligned}$$

It is easy to see that $\lambda n : \mathbb{N}. \lambda u : \perp. u : \forall n : \mathbb{N}. (\perp \Rightarrow \perp)$, so:

$$\text{ind-}s(P_\perp)(\lambda n : \mathbb{N}. \lambda u : \perp. u) : \forall n : \mathbb{N}. \perp.$$

Since $0 : \mathbb{N}$, it follows that $\text{ind-}s(P_\perp)(\lambda n : \mathbb{N}. \lambda u : \perp. u)0 : \perp$.

10.4 $\Delta ; \Gamma$ is a legal combination, so there are M, N such that $\Delta ; \Gamma \vdash M : N$.

To prove: $\Delta ; \Gamma \vdash * : \square$.

We use induction on the structure of the derivation of $\Delta ; \Gamma \vdash M : N$. We only treat here three of the eleven cases, namely: the last step in the derivation was *(var)*, *(weak)* or *(def)*.

(var) Then $\Delta ; \Gamma \vdash M : N \equiv \Delta ; \Gamma', x : A \vdash x : A$, as a conclusion from **premiss** $\Delta ; \Gamma' \vdash A : s$.

By induction, the **premiss** gives us: $\Delta ; \Gamma' \vdash * : \square$.

Then we can derive with *(weak)*:

$$\frac{\Delta ; \Gamma' \vdash * : \square \quad \Delta ; \Gamma' \vdash A : s}{\Delta ; \Gamma', x : A \vdash * : \square},$$

where the derived judgement is identical to $\Delta ; \Gamma \vdash * : \square$.

(weak) Then $\Delta ; \Gamma \vdash M : N \equiv \Delta ; \Gamma', x : C \vdash A : B$, as a conclusion from **premisses** $\Delta ; \Gamma' \vdash A : B$ and $\Delta ; \Gamma' \vdash C : s$.

By induction, either of the **premisses** gives us: $\Delta ; \Gamma' \vdash * : \square$.

Then we can derive with *(weak)*:

$$\frac{\Delta ; \Gamma' \vdash * : \square \quad \Delta ; \Gamma' \vdash C : s}{\Delta ; \Gamma', x : C \vdash * : \square},$$

where the derived judgement is identical to $\Delta ; \Gamma \vdash * : \square$.

(def) Then $\Delta, \Gamma \vdash M : N \equiv \Delta', \bar{x} : \bar{A} \triangleright a(\bar{x}) := M' : N' ; \Gamma \vdash K : L$, as a conclusion from **premisses** $\Delta' ; \Gamma \vdash K : L$ and $\Delta' ; \bar{x} : \bar{A} \vdash M' : N'$.

By induction, the first **premiss** gives us: $\Delta' ; \Gamma \vdash * : \square$.

Then we can derive with *(def)*:

$$\frac{\Delta' ; \Gamma \vdash * : \square \quad \Delta' ; \bar{x} : \bar{A} \vdash M' : N'}{\Delta', \bar{x} : \bar{A} \triangleright a(\bar{x}) := M' : N' ; \Gamma \vdash * : \square},$$

where the derived judgement is identical to $\Delta ; \Gamma \vdash * : \square$.

10.5 Let $\Delta; \Gamma$ be a legal combination, where $x : A \in \Gamma$.

Then there are Γ_1 and Γ_2 such that $\Gamma \equiv \Gamma_1, x : A, \Gamma_2$, and there are M and N such that $\Delta : \Gamma \vdash M : N$, i.e., $\Delta; \Gamma_1, x : A, \Gamma_2 \vdash M : N$.

To prove: $\Delta; \Gamma_1, x : A, \Gamma_2 \vdash x : A$.

We proceed by induction on the structure of the derivation of $\Delta; \Gamma \vdash M : N$. See Figures 9.3 and 10.1.

First note that $\Delta; \Gamma$ does not change in the transition from (at least) one of the **premisses** to the **conclusion** of the derivation rules (*form*), (*appl*), (*abst*), (*conv*), (*inst*) and (*inst-prim*). This implies that in all these cases, induction immediately leads to the desired result.

Secondly, the case (*sort*) also gives the desired result, because the condition is not satisfied (since we suppose that $x : A \in \Gamma$).

What remains, are the four cases (*var*), (*weak*), (*def*) and (*def-prim*). For the first two of these cases, we distinguish between::

subcase a: $x : A$ is the final assumption in Γ , i.e., $\Gamma_2 \equiv \emptyset$,

subcase b: $x : A$ is *not* the final assumption, i.e., $\Gamma_2 \not\equiv \emptyset$.

Case 1: (*var*).

Subcase 1a: $\Gamma_2 \equiv \emptyset$. Then for $\Delta; \Gamma \vdash M : N$ we have the **conclusion** $\Delta; \Gamma_1, x : A \vdash x : A$, so we are ready.

Subcase 1b: $\Gamma_2 \not\equiv \emptyset$. Then for $\Delta; \Gamma \vdash M : N$ we have the **conclusion** $\Delta; \Gamma_1, x : A, \Gamma', y : B \vdash y : B$. The **premiss** is $\Delta; \Gamma_1, x : A, \Gamma' \vdash B : s (*)$. By induction on $(*)$: $\Delta; \Gamma_1, x : A, \Gamma' \vdash x : A (**)$. By (*weak*) on $(**)$ and $(*)$, we obtain: $\Delta; \Gamma_1, x : A, \Gamma', y : B \vdash x : A$, so we are ready.

Case 2: (*weak*).

Subcase 2a: $\Gamma_2 \equiv \emptyset$. Then for $\Delta; \Gamma \vdash M : N$ we have the **conclusion** $\Delta; \Gamma_1, x : A \vdash B : C$. So **premiss₁** is $\Delta; \Gamma_1 \vdash B : C$ and **premiss₂** is $\Delta; \Gamma_1 \vdash A : s (*)$. By (*var*) on $(*)$ we have $\Delta; \Gamma_1, x : A \vdash x : A$

Subcase 2b: $\Gamma_2 \not\equiv \emptyset$. Then for $\Delta; \Gamma \vdash M : N$ we have the **conclusion** $\Delta; \Gamma_1, x : A, \Gamma', y : C \vdash D : E$. So **premiss₁** is $\Delta; \Gamma_1, x : A, \Gamma' \vdash D : E$ and **premiss₂** is $\Delta; \Gamma_1, x : A, \Gamma' \vdash C : s (*)$.

By induction on either of the **premisses**: $\Delta; \Gamma_1, x : A, \Gamma' \vdash x : A (**)$. By (*weak*) on $(**)$ and $(*)$ we obtain: $\Delta; \Gamma_1, x : A, \Gamma', y : C \vdash x : A$.

Case 3: (*def*).

Then for $\Delta; \Gamma \vdash M : N$ we have the **conclusion** $\Delta_1, d; \Gamma \vdash M : N$, where $d \equiv \bar{x} : \bar{A} \triangleright a(\bar{x}) := S : T$. Now **premiss₁** is $\Delta_1; \Gamma \vdash M : N (*)$ and **premiss₂** is $\Delta_1; \bar{x} : \bar{A} \vdash T : s (**)$.

By induction on $(*)$: $\Delta_1; \Gamma \vdash x : A (***)$. By (*def*) on $(***)$ and $(**)$ we obtain: $\Delta_1, d; \Gamma \vdash x : A$.

Case 4: (*def-prim*). Similar to case 3.

Chapter 11

11.3

- (1) $\emptyset ; \emptyset \vdash * : \square$ (*sort*)
- (2) $\emptyset ; S : * \vdash * : \square$ (*weak*) on (1) and (1)
- (3) $\emptyset ; S : * \vdash S : *$ (*var*) on (1)
- (4) $\emptyset ; S : *, x : S \vdash * : \square$ (*weak*) on (2) and (3)
- (5) $\emptyset ; S : * \vdash \Pi x : S. * (\equiv S \rightarrow *) : \square$ (*form*) on (3) and (4)
- (6) $\emptyset ; S : *, P : S \rightarrow * \vdash S : *$ (*weak*) on (3) and (5)

with $\mathcal{D}_4 \equiv \Gamma \triangleright \forall(S, P) := \Pi x : S. Px : *$

11.6 (a)

Let $\Delta \equiv \mathcal{D}', \mathcal{D}''$.

- (1) $\Delta ; \emptyset \vdash * : \square$ (*assumption*)
- (2) $\Delta ; \alpha : * \vdash \alpha : *$ (*var*) on (1)
- (3) $\Delta ; \alpha : * \vdash \neg(\alpha) : *$ (*inst*) on (2) and definition of \neg
- (4) $\Delta ; \alpha : * \vdash \vee(\alpha, \neg(\alpha)) : *$ (*inst*) on (1), (2) and definition of \vee
- (5) $\Delta ; \emptyset \vdash \Pi \alpha : *. \vee(\alpha, \neg(\alpha)) : *$ (*form*) on (1) and (4)

11.6 (b)

- (6) $\Delta, i_{ET} := \perp : \Pi \alpha : *. \vee(\alpha, \neg(\alpha)) ; \emptyset \vdash * : \square$ (*def-prim*) on (1) and (5)

11.9 (c)

For the derivation using the type-theoretic style, see below.

In the natural deduction style, the proof objects for a_2, a_3, a_5 and a_6 in the derivation should read:

$$\begin{aligned}
 a_2(S, P, u, y, v) &:= \neg\text{-el}(\exists x : S. \neg(Px), u, a_1(S, P, u, y, v)) \\
 a_3(S, P, u, y) &:= \neg\text{-in}(\neg(Py), \lambda v : \neg(Py). a_2(S, P, u, y, v)) \\
 a_5(S, P, u) &:= \forall\text{-in}(S, P, \lambda y : S. a_4(S, P, u, y)) \\
 a_6(S, P) &:= \Rightarrow\text{-in}(\neg\exists x : S. \neg(Px), \forall y : S. Py, \\
 &\quad \lambda u : (\neg\exists x : S. \neg(Px)). a_5(S, P, u))
 \end{aligned}$$

$$\begin{array}{l}
\boxed{S : * \mid P : S \rightarrow *} \\
\boxed{u : \neg \exists x : S . \neg(P x)} \\
\boxed{y : S} \\
\boxed{v : \neg(P y)} \\
a_1(S, P, u, y, v) := \exists\text{-in}(S, \lambda z : S . \neg(P z), y, v) : \exists y : S . \neg(P y) \\
a_2(S, P, u, y, v) := u a_1(S, P, u, y, v) : \perp \\
a_3(S, P, u, y) : \lambda v : \neg(P y) . a_2(S, P, u, y, v) : \neg\neg(P y) \\
a_4(S, P, u, y) := \neg\neg\text{-el}(P y, a_3(S, P, u, y)) : P y \\
a_5(S, P, u) := \lambda y : S . a_4(S, P, u, y) : \forall y : S . P y \\
a_6(S, P) := \lambda u : (\neg \exists x : S . \neg(P x)) . a_5(S, P, u) : \\
\neg \exists x : S . \neg(P x) \Rightarrow \forall y : S . P y
\end{array}$$

11.10

$$\begin{array}{l}

\quad \forall x : S . P x \Leftrightarrow \neg \exists y : S . \neg(P y)
\end{array}$$

Notes:

(i) In line (1) we assume that Exercise 11.15 (a) has been worked out in a derivation, so that we can use its result. (The index of the final line of that derivation should yet be put in.) One can, of course, also construct the proof *here* to derive from $\exists y : S . \neg(P y)$ that $\neg \forall x : S . P x$.

(ii) In line (5) we use the final line of Figure 11.26. This is shorter – and more in line with what we advocate in the book – than to ‘duplicate’ the proof in the present situation, so with $\lambda y : S . \neg(P y)$ instead of P .

\end{array}$$

14.9 (a)

Take R such that $x \in \mathbb{Z}$ is related to $y \in \mathbb{Z}$ (which we write as $x R y$) iff $(y = sx \wedge pos(y)) \vee (y = px \wedge neg(y))$.

Then we have on the one hand: $0 R 1 R 2 R 3 R \dots$,
and on the other hand: $0 R (-1) R (-2) R (-3) R \dots$

It will be clear that no chain $\dots x_3 R x_2 R x_1 R x_0$ can be infinitely expanded on the left.

14.9 (b)

Then we obtain for example

$$g 1 = f_1(g 0) = f_1(f_2(g 1)) = f_1(f_2(f_1(g 0))) = \dots, \text{ ad infinitum.}$$

The corresponding relation is now:

$$x R y \Leftrightarrow ((y = sx) \vee (y = px)).$$

So, for example, $0 R 1$ since $1 = s 0$ and $1 R 0$ since $0 = p 1$. Consequently, we have the left-infinite (i.e. infinite descending) chain $\dots 1 R 0 R 1 R 0 R 1$.

14.12 (c)

Lemma 14.6.5 (a): $\forall x, y, z : \mathbb{Z}. (x + z = y + z \Rightarrow x = y)$.

Proof Let x, y be fixed in \mathbb{Z} . Proceed by symmetric induction on z in \mathbb{Z} . Let $Q := \lambda z : \mathbb{Z}(x + z = y + z \Rightarrow x = y)$.

(1) $Q\ 0$? I.e. $x + 0 = y + 0 \Rightarrow x = y$? Yes, by *eq-subs*, *plus-i* and \Rightarrow -*in*.

(2) Induction hypothesis: $Q\ z$, i.e. $x + z = y + z \Rightarrow x = y$.

(2a) $Q(s\ z)$?

$x + s\ z = y + s\ z$
$s(x + z) = s(y + z)$ by <i>plus-ii</i> (twice)
$x + z = y + z$ since s is a bijection
$x = y$ by induction hypothesis
$x + s\ z = y + s\ z \Rightarrow x = y$, so $Q(s\ z)$

(2b) $Q(p\ z)$?

$x + p\ z = y + p\ z$
$p(x + z) = p(y + z)$ by <i>plus-iii</i> (twice)
$x + z = y + z$ since p is a bijection
$x = y$ by induction hypothesis
$x + p\ z = y + p\ z \Rightarrow x = y$, so $Q(p\ z)$

Hence $\forall z : \mathbb{Z}. (Q\ z \Rightarrow (Q(s\ z) \wedge Q(p\ z)))$.

So by symmetric induction: $\forall z : \mathbb{Z}. Q\ z$.

Final conclusion by \forall -*in* (twice): $\forall x, y, z : \mathbb{Z}. (x + z = y + z \Rightarrow x = y)$. □

14.33 (part one) Lemma 14.11.3 (a): $\forall x, y : \mathbb{Z}. (x \cdot y = y \cdot x)$.

Proof Let x be fixed in \mathbb{Z} .

To prove: $\forall y : \mathbb{Z}. (x \cdot y = y \cdot x)$. We apply symmetric induction.

Take $P(x) := \lambda y : \mathbb{Z}. (x \cdot y = y \cdot x)$.

(1) To prove: $P(x) 0$, i.e. $x \cdot 0 = 0 \cdot x$.

$$x \cdot 0 \stackrel{\text{times-i}}{=} 0 \stackrel{\text{Lem. 14.11.1 (a)}}{=} 0 \cdot x.$$

(2) Let $y : \mathbb{Z}$. Assume (induction hypothesis): $P(x) y$, i.e. $x \cdot y = y \cdot x$.

(2a) To prove: $P(x) (sy)$, i.e. $x \cdot sy = sy \cdot x$.

$$x \cdot sy \stackrel{\text{times-ii}}{=} x \cdot y + x \stackrel{\text{ind. hyp.}}{=} y \cdot x + x \stackrel{\text{Lem. 14.11.1 (b)}}{=} sy \cdot x.$$

(2b) To prove: $P(x) (py)$, i.e. $x \cdot py = py \cdot x$.

$$x \cdot py \stackrel{\text{times-iii}}{=} x \cdot y - x \stackrel{\text{ind. hyp.}}{=} y \cdot x - x \stackrel{\text{Lem. 14.11.1 (c)}}{=} py \cdot x.$$

(3) Hence $P(x) 0 \wedge \forall y : \mathbb{Z}. (P(x) y \Rightarrow (P(x) (sy) \wedge P(x) (py)))$.

So, by symmetric induction: $\forall y : \mathbb{Z}. P(x) y$, i.e. $\forall y : \mathbb{Z}. (x \cdot y = y \cdot x)$.

Final conclusion: $\forall x, y : \mathbb{Z}. (x \cdot y = y \cdot x)$.

$a_4 := \dots \text{ use } \wedge\text{-el}_2 \text{ on } a_2 \dots : d \mid n$

15.1 (b)

We first formulate two lemmas:

Lemma I Let $a, b, c : \mathbb{Z}$ such that $a \cdot b = c$. Assume $a > 0$ and $c > 0$. Then $b > 0$.

Proof

(1) Assume that $b < 0$.

Then $a \cdot b < 0$ by Lemma 14.11.5 (c), so $c < 0$. This implies $\text{neg}(c)$ by Lemma 14.10.2 (b), so $\neg\text{pos}(c)$ by Lemma 14.3.3 (b). But $\text{pos}(c)$ by assumption u (see part (a)) and Lemma 14.10.2 (a), so we have a contradiction. Hence, $\neg(b < 0)$.

(2) Assume that $b = 0$.

Then $a \cdot b = 0$ by Lemma 14.11.3 (a) and Lemma 14.11.1 (a), so $c = 0$. But by $\wedge\text{-el}_2$ on $c > 0$, we also have $c \neq 0$. Contradiction, again. So $b \neq 0$.

From Lemma 14.10.2 (c) follows that $b > 0$. □

Lemma II Let $a, b : \mathbb{Z}$ such that $a \cdot b \leq a$. Assume $a > 0$ and $b > 0$. Then $b = 1$.

Proof

(Left to the reader) □

We continue with the same context as in part (a). Then, by a_3 of part (a): $\exists k : \mathbb{Z}. (d \cdot k = m)$. So let $k : \mathbb{Z}$ such that $d \cdot k = m$.

Now $\text{gcd-pos}(m, n, u, v)$ (see Figure 14.23) proves that $d > 0$, so we can use Lemma I to derive that $k > 0$.

Also, by a_4 of part (a): $\exists l : \mathbb{Z}. (d \cdot l = n)$. It follows, in a similar manner as above, that we also have $l > 0$. (Note: in a formal λD -derivation we can

easily conclude this from the derivation of $k > 0$, by an appropriate parameter substitution.)

Now define $g := \text{gcd}(k, l, \text{exp}_1, \text{exp}_2)$, with exp_1 the proof of $k > 0$ and exp_2 the proof of $l > 0$.

Moreover, $g \mid k$ and $g \mid l$, so $\exists a : \mathbb{Z}. (g \cdot a = k)$ and $\exists b : \mathbb{Z}. (g \cdot b = l)$. So let $a, b : \mathbb{Z}$ such that $\text{ass}_1 : g \cdot a = k$ and $\text{ass}_2 : g \cdot b = l$.

Then $m = d \cdot k = d \cdot (g \cdot a) = (d \cdot g) \cdot a$ and $n = d \cdot l = d \cdot (g \cdot b) = (d \cdot g) \cdot b$, both by properties of eq and Lemma 14.11.3 (b).

Use $\exists\text{-in}$ (twice) to obtain $d \cdot g \mid m$ and $d \cdot g \mid n$, hence $\text{com-div}(d \cdot g, m, n)$.

From a_1 of part (a) follows that $\forall p : \mathbb{Z}. (\text{com-div}(p, m, n) \Rightarrow p \leq d)$. Combine this with the previous result, to obtain $d \cdot g \leq d$. Now Lemma II gives $g = 1$ (note that $g > 0$ by $\text{gcd-pos}(k, l, \text{exp}_1, \text{exp}_2)$), which is also the final result after an appropriate number of applications of the $\exists\text{-el}$ -rule.

So we are ready.

15.3 To prove: $\exists x : \mathbb{Z}. \text{lw-bnd}_{\mathbb{Z}}(S^+, x)$.

1 := s0 : \mathbb{Z}

$t : \mathbb{Z} \mid u : t \in S^+$

$a_1 := \dots$ use $\wedge\text{-el}_2 \dots : t \in \mathbb{N}^+$

$a_2 := a_1 : t > 0$

$a_3 := \dots$ use $\wedge\text{-el}_1$ on $a_2 \dots : t - 0 \in \mathbb{N}$

$a_4 := \dots$ use Lemma 14.8.5 $\dots : t \in \mathbb{N}$

$a_5 := \dots$ use $\wedge\text{-el}_2$ on $a_2 \dots : t \neq 0$

$a_6 := \dots$ use Lemma 14.3.1 $\dots : t = 0 \vee pt \in \mathbb{N}$

$a_7 := \dots$ use $\vee\text{-el-alt}_1 \dots : pt \in \mathbb{N}$

$a_8 := \dots$ use Lemma 14.8.8 (b) $\dots : t - 1 \in \mathbb{N}$

$a_9 := a_8 : 1 \leq t$

$a_{10} := \dots$ use $\Rightarrow\text{-in}$ and $\forall\text{-in} \dots : \forall t : \mathbb{Z}. (t \in S^+ \Rightarrow 1 \leq t)$

$a_{11} := a_{10} : \text{lw-bnd}_{\mathbb{Z}}(S^+, 1)$

$a_{12} := \dots$ use $\exists\text{-in}$ on 1 and $a_{11} \dots : \exists x : \mathbb{Z}. \text{lw-bnd}_{\mathbb{Z}}(S^+, x)$

15.7 Minimum Theorem:

$T : \text{ps}(\mathbb{Z}) \mid u : T \neq \emptyset_{\mathbb{Z}} \mid v : \exists x : \mathbb{Z}. \text{lw-bnd}_{\mathbb{Z}}(T, x)$
--

$\text{min-the}(T, u, v) := \dots : \exists y : \mathbb{Z}. \text{least}_{\mathbb{Z}}(T, y)$
--

Now we give a proof sketch of the Maximum Theorem:

$T : ps(\mathbb{Z}) \mid u : T \neq \emptyset_{\mathbb{Z}} \mid v : \exists x : \mathbb{Z}. up\text{-}bnd_{\mathbb{Z}}(T, x)$ [see Fig. 15.19]

[To prove : $\exists y : \mathbb{Z}. grtst_{\mathbb{Z}}(T, y)$]

$$(1) \quad \begin{aligned} T' &:= \{x : \mathbb{Z} \mid -x \in T\} \\ T' &: ps(\mathbb{Z}) \end{aligned}$$

$\exists x : \mathbb{Z}. x \in T$ by u and Figure 13.8. Use $\exists\text{-}el$ on this :

$x : \mathbb{Z} \mid ass_1 : x \in T$

$-(-x) \in T$

$-x : \mathbb{Z}$

$-x \in T'$

$\exists y : \mathbb{Z}. y \in T'$

$T' \neq \emptyset_{\mathbb{Z}}$ by Figure 13.8

$$(2) \quad T' \neq \emptyset_{\mathbb{Z}} \text{ by } \exists\text{-}el; \text{ inhabitant is (say) } a$$

Now use $\exists\text{-}el$ on v :

$x : \mathbb{Z} \mid ass_2 : up\text{-}bnd_{\mathbb{Z}}(T, x)$ [$=_{\delta} \forall t : \mathbb{Z}. (t \in T \Rightarrow t \leq x)$]

[We now show that $-x$ is a lower bound of T' :]

$t : S \mid ass_3 : t \in T'$

$-t \in T$

$-t : \mathbb{Z}$

$-t \leq x$ by ass_2

$x - (-t) \in \mathbb{N}$

$x + t \in \mathbb{N}$

$t - (-x) \in \mathbb{N}$

$-x \leq t$

$\forall t : S. (t \in T' \Rightarrow -x \leq t)$

$lw\text{-}bnd_{\mathbb{Z}}(T', -x)$

$\exists y : \mathbb{Z}. lw\text{-}bnd_{\mathbb{Z}}(T', y)$

$$(3) \quad \exists y : \mathbb{Z}. lw\text{-}bnd_{\mathbb{Z}}(T', y) \text{ by } \exists\text{-}el; \text{ inhabitant is (say) } b$$

Apply $min\text{-}the$ on (1), (2) and (3) :

$min\text{-}the(T', a, b) : \exists m : \mathbb{Z}. least_{\mathbb{Z}}(T', m)$

Use $\exists\text{-}el$ on this; so let m be a least element of T' ,

we shall now show that $-m$ is a greatest element of T :

<table border="1" style="border-collapse: collapse; width: 100%; border: none;"> <tr> <td style="border: none; padding: 5px;"> <table border="1" style="border-collapse: collapse; width: 100%; border: none;"> <tr> <td style="border: none; padding: 5px;"> <table border="1" style="border-collapse: collapse; width: 100%; border: none;"> <tr> <td style="border: none; padding: 5px;"> $m : \mathbb{Z} \mid \text{ass}_4 : \text{least}_{\mathbb{Z}}(T', m) \quad [=_{\delta} m \in T' \wedge \text{lw-bnd}_{\mathbb{Z}}(T', m)]$ </td> </tr> </table> </td> </tr> <tr> <td style="border: none; padding: 5px;"> $m \in T'$ </td> </tr> <tr> <td style="border: none; padding: 5px;"> <table border="1" style="border-collapse: collapse; width: 100%; border: none;"> <tr> <td style="border: none; padding: 5px;"> $t : S \mid \text{ass}_5 : t \in T$ </td> </tr> </table> </td> </tr> <tr> <td style="border: none; padding: 5px;"> $-(-t) \in T$ </td> </tr> <tr> <td style="border: none; padding: 5px;"> $-t : \mathbb{Z}$ </td> </tr> <tr> <td style="border: none; padding: 5px;"> $-t \in T'$ </td> </tr> <tr> <td style="border: none; padding: 5px;"> $m \leq -t$ by ass_4 </td> </tr> <tr> <td style="border: none; padding: 5px;"> $(-t) - m \in \mathbb{N}$ </td> </tr> <tr> <td style="border: none; padding: 5px;"> $-(t + m) \in \mathbb{N}$ </td> </tr> <tr> <td style="border: none; padding: 5px;"> $-(m + t) \in \mathbb{N}$ </td> </tr> <tr> <td style="border: none; padding: 5px;"> $(-m) - t \in \mathbb{N}$ </td> </tr> <tr> <td style="border: none; padding: 5px;"> $t \leq -m$ </td> </tr> <tr> <td style="border: none; padding: 5px;"> $\forall t : S.
