21 This document is an unapproved draft of a proposed IEEE Standard. As such, this document is subject to
22 change. USE AT YOUR OWN RISK! IEEE copyright statements SHALL NOT BE REMOVED from draft
23 or approved IEEE standards, or modified in any way. Because this is an unapproved draft, this document
24 must not be utilized for any conformance/compliance purposes. Permission is hereby granted for officers
25 from each IEEE Standards Working Group or Committee to reproduce the draft document developed by
26 that Working Group for purposes of international standardization consideration. IEEE Standards
27 Department must be informed of the submission for consideration prior to any reproduction for
28 international standardization consideration (stds.ipr@ieee.org). Prior to adoption of this document, in
29 whole or in part, by another standards development organization, permission must first be obtained from
30 the IEEE Standards Department (stds.ipr@ieee.org). When requesting permission, IEEE Standards
31 Department will require a copy of the standard development organization's document highlighting the use
32 of IEEE content. Other entities seeking permission to reproduce this document, in whole or in part, must
33 also obtain permission from the IEEE Standards Department.

37

1 **Abstract:** The XES standard defines a grammar for a tag-based language whose aim is to
2 provide designers of information systems with a unified and extensible methodology for capturing
3 systems' behaviors by means of event logs and event streams. This standard includes a "XML
4 Schema" describing the structure of an XES event log/stream and a "XML Schema" describing
5 the structure of an extension of such a log/stream. Moreover, the standard includes a basic
6 collection of so-called "XES extension" prototypes that provide semantics to certain attributes as
7 recorded in the event log/stream.
8
9 **Keywords:** event log, event stream, system behavior, extensions, XML.

1 **Important Notices and Disclaimers Concerning IEEE Standards Documents**

2 IEEE documents are made available for use subject to important notices and legal disclaimers. These
3 notices and disclaimers, or a reference to this page, appear in all standards and may be found under the
4 heading “Important Notice” or “Important Notices and Disclaimers Concerning IEEE Standards
5 Documents.”

6 **Notice and Disclaimer of Liability Concerning the Use of IEEE Standards 7 Documents**

8 IEEE Standards documents (standards, recommended practices, and guides), both full-use and trial-use, are
9 developed within IEEE Societies and the Standards Coordinating Committees of the IEEE Standards
10 Association (“IEEE-SA”) Standards Board. IEEE (“the Institute”) develops its standards through a
11 consensus development process, approved by the American National Standards Institute (“ANSI”), which
12 brings together volunteers representing varied viewpoints and interests to achieve the final product.
13 Volunteers are not necessarily members of the Institute and participate without compensation from IEEE.
14 While IEEE administers the process and establishes rules to promote fairness in the consensus development
15 process, IEEE does not independently evaluate, test, or verify the accuracy of any of the information or the
16 soundness of any judgments contained in its standards.

17 IEEE does not warrant or represent the accuracy or content of the material contained in its standards, and
18 expressly disclaims all warranties (express, implied and statutory) not included in this or any other
19 document relating to the standard, including, but not limited to, the warranties of: merchantability; fitness
20 for a particular purpose; non-infringement; and quality, accuracy, effectiveness, currency, or completeness
21 of material. In addition, IEEE disclaims any and all conditions relating to: results; and workmanlike effort.
22 IEEE standards documents are supplied “AS IS” and “WITH ALL FAULTS.”

23 Use of an IEEE standard is wholly voluntary. The existence of an IEEE standard does not imply that there
24 are no other ways to produce, test, measure, purchase, market, or provide other goods and services related
25 to the scope of the IEEE standard. Furthermore, the viewpoint expressed at the time a standard is approved
26 and issued is subject to change brought about through developments in the state of the art and comments
27 received from users of the standard.

28 In publishing and making its standards available, IEEE is not suggesting or rendering professional or other
29 services for, or on behalf of, any person or entity nor is IEEE undertaking to perform any duty owed by any
30 other person or entity to another. Any person utilizing any IEEE Standards document, should rely upon his
31 or her own independent judgment in the exercise of reasonable care in any given circumstances or, as
32 appropriate, seek the advice of a competent professional in determining the appropriateness of a given
33 IEEE standard.

34 IN NO EVENT SHALL IEEE BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL,
35 EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO:
36 PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS;
37 OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY,
38 WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR
39 OTHERWISE) ARISING IN ANY WAY OUT OF THE PUBLICATION, USE OF, OR RELIANCE
40 UPON ANY STANDARD, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE AND
41 REGARDLESS OF WHETHER SUCH DAMAGE WAS FORESEEABLE.

42 **Translations**

43 The IEEE consensus development process involves the review of documents in English only. In the event
44 that an IEEE standard is translated, only the English version published by IEEE should be considered the
45 approved IEEE standard.

1 **Official statements**

2 A statement, written or oral, that is not processed in accordance with the IEEE-SA Standards Board
3 Operations Manual shall not be considered or inferred to be the official position of IEEE or any of its
4 committees and shall not be considered to be, or be relied upon as, a formal position of IEEE. At lectures,
5 symposia, seminars, or educational courses, an individual presenting information on IEEE standards shall
6 make it clear that his or her views should be considered the personal views of that individual rather than the
7 formal position of IEEE.

8 **Comments on standards**

9 Comments for revision of IEEE Standards documents are welcome from any interested party, regardless of
10 membership affiliation with IEEE. However, IEEE does not provide consulting information or advice
11 pertaining to IEEE Standards documents. Suggestions for changes in documents should be in the form of a
12 proposed change of text, together with appropriate supporting comments. Since IEEE standards represent a
13 consensus of concerned interests, it is important that any responses to comments and questions also receive
14 the concurrence of a balance of interests. For this reason, IEEE and the members of its societies and
15 Standards Coordinating Committees are not able to provide an instant response to comments or questions
16 except in those cases where the matter has previously been addressed. For the same reason, IEEE does not
17 respond to interpretation requests. Any person who would like to participate in revisions to an IEEE
18 standard is welcome to join the relevant IEEE working group.

19 Comments on standards should be submitted to the following address:

20 Secretary, IEEE-SA Standards Board
21 445 Hoes Lane
22 Piscataway, NJ 08854 USA

23 **Laws and regulations**

24 Users of IEEE Standards documents should consult all applicable laws and regulations. Compliance with
25 the provisions of any IEEE Standards document does not imply compliance to any applicable regulatory
26 requirements. Implementers of the standard are responsible for observing or referring to the applicable
27 regulatory requirements. IEEE does not, by the publication of its standards, intend to urge action that is not
28 in compliance with applicable laws, and these documents may not be construed as doing so.

29 **Copyrights**

30 IEEE draft and approved standards are copyrighted by IEEE under U.S. and international copyright laws.
31 They are made available by IEEE and are adopted for a wide variety of both public and private uses. These
32 include both use, by reference, in laws and regulations, and use in private self-regulation, standardization,
33 and the promotion of engineering practices and methods. By making these documents available for use and
34 adoption by public authorities and private users, IEEE does not waive any rights in copyright to the
35 documents.

36 **Photocopies**

37 Subject to payment of the appropriate fee, IEEE will grant users a limited, non-exclusive license to
38 photocopy portions of any individual standard for company or organizational internal use or individual,
39 non-commercial use only. To arrange for payment of licensing fees, please contact Copyright Clearance
40 Center, Customer Service, 222 Rosewood Drive, Danvers, MA 01923 USA; +1 978 750 8400. Permission
41 to photocopy portions of any individual standard for educational classroom use can also be obtained
42 through the Copyright Clearance Center.

1 **Updating of IEEE Standards documents**

2 Users of IEEE Standards documents should be aware that these documents may be superseded at any time
3 by the issuance of new editions or may be amended from time to time through the issuance of amendments,
4 corrigenda, or errata. An official IEEE document at any point in time consists of the current edition of the
5 document together with any amendments, corrigenda, or errata then in effect.

6 Every IEEE standard is subjected to review at least every ten years. When a document is more than ten
7 years old and has not undergone a revision process, it is reasonable to conclude that its contents, although
8 still of some value, do not wholly reflect the present state of the art. Users are cautioned to check to
9 determine that they have the latest edition of any IEEE standard.

10 In order to determine whether a given document is the current edition and whether it has been amended
11 through the issuance of amendments, corrigenda, or errata, visit the IEEE-SA Website at
12 <http://ieeexplore.ieee.org/xpl/standards.jsp> or contact IEEE at the address listed previously. For more
13 information about the IEEE-SA or IEEE's standards development process, visit the IEEE-SA Website at
14 <http://standards.ieee.org>.

15 **Errata**

16 Errata, if any, for all IEEE standards can be accessed on the IEEE-SA Website at the following URL:
17 <http://standards.ieee.org/findstds/errata/index.html>. Users are encouraged to check this URL for errata
18 periodically.

19 **Patents**

20 Attention is called to the possibility that implementation of this standard may require use of subject matter
21 covered by patent rights. By publication of this standard, no position is taken by the IEEE with respect to
22 the existence or validity of any patent rights in connection therewith. If a patent holder or patent applicant
23 has filed a statement of assurance via an Accepted Letter of Assurance, then the statement is listed on the
24 IEEE-SA Website at <http://standards.ieee.org/about/sasb/patcom/patents.html>. Letters of Assurance may
25 indicate whether the Submitter is willing or unwilling to grant licenses under patent rights without
26 compensation or under reasonable rates, with reasonable terms and conditions that are demonstrably free of
27 any unfair discrimination to applicants desiring to obtain such licenses.

28 Essential Patent Claims may exist for which a Letter of Assurance has not been received. The IEEE is not
29 responsible for identifying Essential Patent Claims for which a license may be required, for conducting
30 inquiries into the legal validity or scope of Patents Claims, or determining whether any licensing terms or
31 conditions provided in connection with submission of a Letter of Assurance, if any, or in any licensing
32 agreements are reasonable or non-discriminatory. Users of this standard are expressly advised that
33 determination of the validity of any patent rights, and the risk of infringement of such rights, is entirely
34 their own responsibility. Further information may be obtained from the IEEE Standards Association.

1 Introduction

2 This introduction is not part of P1849/D01, Draft Standard for XES - eXtensible Event Stream - for achieving
3 interoperability in event logs and event streams .

4 Event logs contain information on how processes have evolved in running systems. As more and more
5 systems capture such information, there is a need to be able to transfer this information from these running
6 systems to a site where the information can be analyzed, either automatically by software from the
7 computational intelligence field, or manually (at least in part) using such software.

8 This Standard addresses this need by defining an eXtensible Event Stream (XES) structure for such event
9 logs.

10 Furthermore, this Standard defines the World Wide Web Consortium (W3C) Extensible Markup Language
11 (XML) structure and constraints on the contents of XML 1.1 documents that can be used to represent XES
12 instances, and a likewise structure (called XESEXT) that can be used to represent so-called extensions to
13 this structure.

14 The purpose of this Standard is to allow the generation and analysis of event logs using XML. This
15 Standard uses the W3C XML Schema definition language as the encoding, which allows for
16 interoperability and the exchange of XES XML instances between various systems.

1 Draft Standard for XES - eXtensible 2 Event Stream - for achieving 3 interoperability in event logs and event 4 streams

5 *IMPORTANT NOTICE: IEEE Standards documents are not intended to ensure safety, security, health,*
6 *or environmental protection, or ensure against interference with or from other devices or networks.*
7 *Implementers of IEEE Standards documents are responsible for determining and complying with all*
8 *appropriate safety, security, environmental, health, and interference protection practices and all*
9 *applicable laws and regulations.*

10 *This IEEE document is made available for use subject to important notices and legal disclaimers.*
11 *These notices and disclaimers appear in all publications containing this document and may*
12 *be found under the heading “Important Notice” or “Important Notices and Disclaimers*
13 *Concerning IEEE Documents.” They can also be obtained on request from IEEE or viewed at*
14 [*http://standards.ieee.org/IPR/disclaimers.html.*](http://standards.ieee.org/IPR/disclaimers.html)

15 1. Overview

16 The scope and purpose of this Standard are discussed in 1.1 and 1.2.

17 1.1 Scope

18 This Standard defines World Wide Web Consortium (W3C) Extensible Markup Language (XML) structure
19 and constraints on the contents of XML 1.1 documents that can be used to represent extensible event
20 stream (XES) instances. A XES instance corresponds to a file-based event log or a formatted event stream
21 that can be used to transfer event-driven data in a transparent manner from a first site to a second site.
22 Typically, the first site will be the site generating this event-driven data (workflow systems, case handling
23 systems, procurement systems, devices like wafer steppers and X-ray machines, hospitals, ...) while the
24 second site will be the site analyzing this data (for example, by data scientists and/or advanced software
25 systems).

26 1.2 Purpose

27 The purpose of this Standard is to provide a generally-acknowledged format for the interchange of event
28 data between tools and applications domains. As such, this Standard aims to fix the syntax and the

1 semantics of the event data which, for example, is being transferred from the site generating this data to the
2 site analyzing this data. As a result of this Standard, if the event data is transferred using the syntax as
3 described by this Standard, its semantics will be well-understood and clear at both sites.

4 **2. Normative references**

5 The following referenced documents are indispensable for the application of this document (i.e., they must
6 be understood and used, so each referenced document is cited in text and its relationship to this document is
7 explained). For dated references, only the edition cited applies. For undated references, the latest edition of
8 the referenced document (including any amendments or corrigenda) applies.

18 **3. Definitions**

19 For the purposes of this document, the following terms and definitions apply. The *IEEE Standards*
20 *Dictionary Online* should be consulted for terms not defined in this clause.¹

21 **component:** A XES element that may contain XES attributes, that is, a log, a trace, an event, or an
22 attribute.

23 **4. XES metadata structure**

24 **4.1 Hierarchical components**

25 **4.1.1 Log component**

26 A *log component* represents all information that is related to a specific process. Examples for processes are
27 handling insurance claims, using a complex X-ray machine, and browsing a website. A log shall contain a
28 (possibly empty) collection of traces followed by a (possibly empty) list of events. The order of the events
29 in this list is important, as it signifies the order in which the events have been observed.

¹*IEEE Standards Dictionary Online* subscription is available at:
http://www.ieee.org/portal/innovate/products/standard/standards_dictionary.html.

1 If the log contains only events and no traces, then the log is also called a *stream*.

2 **4.1.2 Trace component**

3 A *trace component* represents the execution of a single case. A trace shall contain a (possible empty) list of
4 all events that are related to a single case. The order of the events in this list is important, as it signifies the
5 order in which the events have been observed.

6 **4.1.3 Event component**

7 An *event component* represents an atomic granule of activity that has been observed. If the event occurs in
8 some trace, then it is clear to which case the event belongs. If the event does not occur in some trace, that
9 is, if it occurs in the log, then we need ways to relate events to cases. For this, we will use the combination
10 of a trace classifier and an event classifier, see 4.4.

11 **4.2 Attribute component**

12 Information on any component (log, trace, or event) is stored in *attribute components*. Attributes describe
13 the enclosing component, which may contain an arbitrary number of attributes. However, no two attributes
14 of the same component may share the same key, that is, every key may occur only once in a single
15 component.

16 For providing maximum flexibility, this Standard allows for *nested* attributes, that is, attributes that
17 themselves have child attributes. While this feature is necessary for efficient encoding of certain
18 information types, it is *optional for tools to implement nested attributes*, that is, the feature is not strictly
19 required in order to be compliant to this Standard. Nevertheless, a tool that does not support nested
20 attributes shall be able to read documents which feature nested attributes. These tools shall transparently
21 ignore and discard any nested attributes, and, where feasible, alert the user to the fact that some information
22 may not be available.

23 An attribute may be either *elementary* or *composite*.

24 **4.2.1 Elementary attributes**

25 An *elementary attribute* is an attribute that contains an elementary (single, basic) value. In this Standard, an
26 elementary attribute can be a *string attribute*, a *date and time attribute*, an *integer number attribute*, a *real*
27 *number attribute*, a *Boolean attribute*, or an *ID attribute*.

28 **4.2.1.1 String attributes**

29 Valid values for a string attribute are values that conform to the `xs:string` datatype.

30 **4.2.1.2 Date and time attributes**

31 Valid values for a date and time attribute are values that conform to the `xs:dateTime` datatype.

1 **4.2.1.3 Integer number attributes**

2 Valid values for an integer number attribute are values that conform to the `xs:long` datatype.

3 **4.2.1.4 Real number attributes**

4 Valid values for a real number attribute are values that conform to the `xs:double` datatype.

5 **4.2.1.5 Boolean attributes**

6 Valid values for a Boolean attribute are values that conform to the `xs:boolean` datatype.

7 **4.2.1.6 ID attributes**

8 Valid values for an ID attribute are values that conform to the ID datatype, that is, all string representations
9 of UUIDs.

10 **4.2.2 Composite attributes**

11 A *composite attribute* is an attribute that may contain multiple values. In this Standard, a composite
12 attribute is a *list attribute*.

13 **4.2.2.1 List attribute**

14 Valid values for the list datatype are all lists (series) of attribute values. The order between the child
15 attributes in this list is important. In contrast to attributes enclosed in a component, attributes enclosed in a
16 list may share the same key.

17 **4.3 Global attributes**

18 A log shall hold a (possibly empty) list of global attribute declarations. A global attribute declaration shall
19 have a valid *key*, a valid *datatype*, and a valid *value* for the datatype. A global attribute declaration can
20 either be for events or for traces.

21 Global attributes are a required feature for compliance to this Standard. Nevertheless, a defensive approach
22 is recommended with respect to global attributes, as there is no way to undo a global declaration.

23 **4.3.1 Global event attributes**

24 Global event attributes are event attributes that are understood to be *available* and *properly defined* for each
25 event in the log (be it in a trace or not). As a result, every event in the log shall contain an attribute with the
26 given key and the given datatype, but possibly with a different valid value. The value provided for a global
27 event attribute declaration is *only significant* in case an event *needs to be created* (for some reason) for
28 which *no value is provided* for that attribute. In that case, the value of the declaration shall be used as the
29 value for the attribute. In all other cases, the value of the declaration is insignificant, and shall not be used.

1 **4.3.2 Global trace attributes**

2 Global trace attributes are trace attributes that are understood to be *available* and *properly defined* for each
3 trace in the log. As a result, every trace shall contain an attribute with the given key and the given datatype,
4 but possibly with a different valid value. The value provided for a global attribute declaration is *only*
5 *significant* in case a trace *needs to be created* (for some reason) for which *no value is provided* for that
6 attribute. In that case, the value of the declaration shall be used as the value for the attribute. In all other
7 cases, the value of the declaration is insignificant, and shall not be used.

8 **4.4 Classifiers**

9 In this Standard, there are per se no predefined attributes with any well-understood meaning. Instead, a log
10 shall hold a (possibly empty) list of classifiers. *These classifiers are a mandatory feature of this Standard.*

11 A classifier assigns to each event an *identity*, which makes it comparable to others (via their assigned
12 identity). Examples of such identities include the descriptive name of the event, the descriptive name of the
13 case the event relates to, the descriptive name of the cause of the event, and the descriptive name of the
14 case related to the event.

15 A classifier can either be an *event classifier* or a *trace classifier*.

16 In case the log contains events that do not occur in a trace, then it is necessary to be able to relate these
17 events to cases. For this reason, we assume that one of the existing event classifiers provides the descriptive
18 name of its case. Two events for which this classifier result in the same identity, belong to the same case.
19 Furthermore, we assume that one of the trace classifiers provides the descriptive name for the case. If this
20 classifier and the event classifier mentioned earlier return the same identity, then the corresponding event
21 belongs to the same case as the corresponding trace. As such, the event can be appended to this trace. If no
22 matching trace exists, a new trace may be started with the event.

23 **4.4.1 Event classifiers**

24 An event classifier shall be defined via an ordered list of attribute keys. The identity of the event shall be
25 derived from the actual values of the attributes with these keys. An attribute whose key appears in an event
26 classifier list shall be declared as a global event attribute before the event classifier is defined, as the actual
27 value for the attribute is required by the event classifier.

28 **4.4.2 Trace classifiers**

29 A trace classifier shall be defined via an ordered list of attribute keys. The identity of the trace shall be
30 derived from the actual values of the attributes with these keys. An attribute whose key appears in a trace
31 classifier list shall be declared as a global trace attribute before the trace classifier is defined, as the actual
32 value for the attribute is required by the trace classifier.

33 **4.4.3 Event ordering**

34 Within the context of a single trace, the ordering of events shall be important: An event that occurs in a log
35 (be it in a trace or in the log itself) before another event that is related to the same trace, shall be assumed to
36 have occurred before that other event. However, the notion of a trace also depends on the trace and event

1 classifiers selected by the user. As such, the notion of a trace is not necessarily predefined for a log. As a
2 result, the notion of the event ordering may be affected by the choice of classifiers.

3 Whatever classifier is selected by the user, the ordering in the log shall be maintained: The first event that
4 belongs to some trace shall be the first event encountered in the log (be it in a trace or in the log itself), etc.
5 As an example, consider the event log that contains (1) a trace containing events e_{11} and e_{12} , (2) a trace
6 containing an event e_{21} , (3) a trace containing events e_{31} , e_{32} , and e_{33} , and (4) an event e_4 . Now, assume that
7 the user has selected an event classifier and a trace classifier that causes the events e_{11} , e_{31} , e_{33} , and e_4 to
8 belong to the same trace. Then the ordering in this (classified) trace shall be e_{11} , e_{31} , e_{33} , and e_4 .

9 4.5 Extensions

10 This Standard does not define a specific set of attributes per component. As such, the semantics of the data
11 attributes these elements do contain must necessarily be ambiguous, hampering the interpretation of that
12 data.

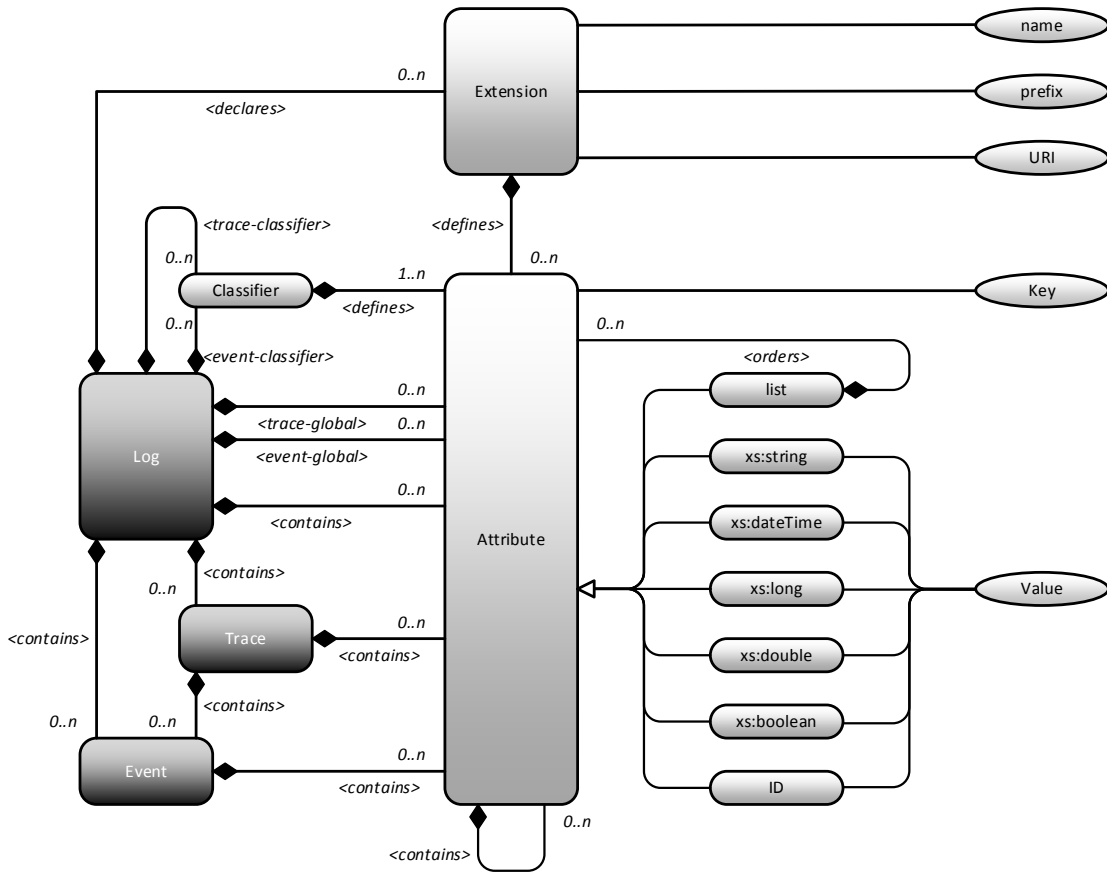

13 This ambiguity is resolved by the concept of *extensions* in this Standard. An extension defines for every
14 type of component a (possibly empty) set of attributes. The extension provides points of reference for
15 interpreting these attributes, and, thus, their components. Extensions therefore are *primarily a vehicle for*
16 *attaching semantics to a set of defined attributes per component.*

17 Extensions have many possible uses. One important use is to introduce a set of commonly understood
18 attributes which are vital for a specific perspective or dimension of event log analysis (and which may even
19 not have been foreseen at the time of developing this Standard). See Clause 7 for the current set of standard
20 extensions.

21 Other uses include the definition of generally-understood attributes for a specific application domain (for
22 example, medical attributes for hospital processes), or for supporting special features or requirements of a
23 specific application.

24 An extension shall have a descriptive *name*, a *prefix*, and a *URI*. The prefix is the prefix of all attributes
25 defined by the extension. This means, the keys of all attributes defined by the extension will be prepended
26 with this prefix and colon separation character (like a namespace in XML). The URI is a unique URI which
27 points to the definition of the extension.

28 The definition of the extension shall contain for every component a (possibly empty) list of attribute
29 declarations. An attribute declaration shall contain the *key* of the attribute, the *datatype* of the attribute, and
30 a (possible empty) list of *aliases*. An alias shall contain the *descriptive text* for the attribute (that is, the
31 commonly understood semantics for the attribute) and the *language code* of the language of this descriptive
32 text.

Figure 1 Overview of the XES metadata structure

3 **5. XES XML serialization**

4 **5.1 Log element**

5 Captures the log component from the XES metadata structure.

6 — XML name: log.

7 **5.1.1 Elements**

8 The following (sub) elements should appear in the specified order.

XML name	XES element	Min	Max	Description
extension	Extension, see 5.5.	0	∞	An extension declaration for the log.
global	Global, see 5.6.	0	∞	A global (event or trace) attribute for the log.

classifier	Classifier, see 5.7.	0	∞	A classifier (even tor trace) definition for the log.
attribute	Attribute, see 5.4.	0	∞	An attribute for the log. May be elementary or composite.
trace	Trace, see 5.2.	0	∞	A trace for the log.
event	Event, see 5.3.	0	∞	An event for the log.

1 5.1.2 Attributes

<i>Attribute key</i>	<i>Attribute type</i>	<i>Status</i>	<i>Description</i>
xes.version	xs:decimal	Required	The version of the XES standard the document conforms to (e.g., 2.0).
xes.features	xs:token	Required	A whitespace-separated list of optional XES features this document makes use of (e.g., nested-attributes). If not optional features are used, this attribute should have an empty value.

2 5.2 Trace element

3 Captures the trace component from the XES metadata structure.

4 — XML name: trace.

5 5.2.1 Elements

6 The following (sub) elements should appear in the specified order.

<i>XML name</i>	<i>XES element</i>	<i>Min</i>	<i>Max</i>	<i>Description</i>
attribute	Attribute, see 5.4.	0	∞	An attribute for the trace. May be elementary or composite.
event	Event, see 5.3.	0	∞	An event for the trace.

7 5.2.2 Attributes

8 N/A.

9 5.3 Event element

10 Captures the event component from the XES metadata structure.

1 — XML name: event.

2 **5.3.1 Elements**

3 The following (sub) elements should appear in the specified order.

<i>XML name</i>	<i>XES element</i>	<i>Min</i>	<i>Max</i>	<i>Description</i>
attribute	Attribute, see 5.4.	0	∞	An attribute for the event. May be elementary or composite.

4 **5.3.2 Attributes**

5 N/A.

6 **5.4 Attribute element**

7 Captures the attribute component from the XES metadata structure. Can be any of the following:

<i>XML name</i>	<i>Datatype</i>	<i>Value</i>	<i>Description</i>
string	xs:string	Elementary	A string value.
date	xs:dateTime	Elementary	A data and time value.
int	xs:long	Elementary	An integer number value.
float	xs:double	Elementary	A real number value.
boolean	xs:boolean	Elementary	A Boolean value.
id	ID	Elementary	A UUID value.
list	Attribute list	Composite	A sorted list of attributes.

8 **5.4.1 Elements for elementary attributes**

9 The following (sub) elements should appear in the specified order.

<i>XML name</i>	<i>XES element</i>	<i>Min</i>	<i>Max</i>	<i>Description</i>
attribute	Attribute, see 5.4.	0	∞	An attribute for the attribute, that is, a meta-attribute. May be elementary or composite.

10 **5.4.2 Elements for composite attributes**

11 The following (sub) elements should appear in the specified order.

<i>XML name</i>	<i>XES element</i>	<i>Min</i>	<i>Max</i>	<i>Description</i>
attribute	Attribute, see 5.4.	0	∞	An attribute for the attribute, that is, a meta-attribute. May be elementary or composite.
values	Attribute list	1	1	The ordered list of attributes that constitute the composite value of the attribute. Attributes in this list may be elementary and composite, and attributes in this list may share the same key.

1 **5.4.3 Attributes for elementary attributes**

<i>Attribute key</i>	<i>Attribute type</i>	<i>Status</i>	<i>Description</i>
key	xs:string	Required	The key of the attribute.
value	xs:string	Required	The value (as a string) of the elementary attribute.

2 **5.4.4 Attributes for composite attributes**

<i>Attribute key</i>	<i>Attribute type</i>	<i>Status</i>	<i>Description</i>
key	xs:string	Required	The key of the attribute.

3 **5.5 Extension element**

4 Captures the extension declaration from the XES metadata structure.

5 — XML name: extension.

6 **5.5.1 Elements**

7 N/A.

8 **5.5.2 Attributes**

<i>Attribute key</i>	<i>Attribute type</i>	<i>Status</i>	<i>Description</i>
name	xs:NCName	Required	The name of the extension.
prefix	xs:NCName	Required	The prefix of the extension.
uri	xs:anyURI	Required	The URI from where the definition of this extension (should be a file that conforms to the

	XESEXT format) can be retrieved.
--	----------------------------------

1 **5.6 Global element**

2 Captures the global attribute declaration from the XES metadata structure.

3 — XML name: `global`.

4 **5.6.1 Elements**

<i>XML name</i>	<i>XES element</i>	<i>Min</i>	<i>Max</i>	<i>Description</i>
attribute	Attribute, see 5.4.	1	1	A global attribute declaration for the log. Depending on whether the attribute is declared global for events or traces, every event or trace in the log should have this attribute as sub element.

5 The attribute value provided with this global declaration should only be used if a new event or trace needs
 6 to be inserted in the log for which no other valid value for this attribute can be obtained. In that case, and
 7 only in that case, may the value of this attribute be used.

8 **5.6.2 Attributes**

<i>Attribute key</i>	<i>Attribute type</i>	<i>Status</i>	<i>Description</i>
scope	<code>xs:NCName</code>	Optional	Either event or trace, to denote whether this attribute is declared global for events or traces. The default is event .

9 **5.7 Classifier element**

10 Captures the classifier definition from the XES metadata structure.

11 — XML name: `classifier`.

12 **5.7.1 Elements**

13 N/A.

14 **5.7.2 Attributes**

<i>Attribute key</i>	<i>Attribute type</i>	<i>Status</i>	<i>Description</i>
----------------------	-----------------------	---------------	--------------------

name	xs:NCName	Required	The name of the classifier.
scope	xs:NCName	Optional	Either <code>event</code> or <code>trace</code> , to denote whether this classifier can be used to classify events or traces. The default is <code>event</code> .
keys	xs:token	Required	The white-space-separated list of attribute keys that constitute this classifier.

1
2

Figure 2 State machine flow diagram for XES XML serialization

1 **6. XESEXT XML Serialization**

2 **6.1 XESExtension element**

3 Captures the extension definition from the XES metadata structure.

4 — XML name: `xesextension`.

5 **6.1.1 Elements**

6 The following (sub) elements should appear in the specified order.

<i>XML name</i>	<i>XESEXT element</i>	<i>Min</i>	<i>Max</i>	<i>Description</i>
log	Log, see 6.2.	0	1	Attribute definitions for logs.
trace	Trace, see 6.3.	0	1	Attribute definitions for traces.
event	Event, see 6.4	0	1	Attribute definitions for events.
meta	Meta, see 6.5	0	1	Attribute definitions for attributes.

7 **6.1.2 Attributes**

<i>Attribute key</i>	<i>Attribute type</i>	<i>Status</i>	<i>Description</i>
name	<code>xs:NCName</code>	Required	The name of the extension.
prefix	<code>xs:NCName</code>	Required	The prefix to be used for this extension.
uri	<code>xs:anyURI</code>	Required	The URI where this extension can be retrieved from.

8 **6.2 Log element**

9 Captures the log extension definition from the XES metadata structure.

10 — XML name: `log`.

11 **6.2.1 Elements**

12 The following (sub) elements should appear in the specified order.

<i>XML name</i>	<i>XESEXT element</i>	<i>Min</i>	<i>Max</i>	<i>Description</i>
-----------------	-----------------------	------------	------------	--------------------

attribute	Attribute, see 6.6.	0	∞	Attribute definition for logs.
-----------	---------------------	---	----------	--------------------------------

1 **6.2.2 Attributes**

2 N/A.

3 **6.3 Trace element**

4 Captures the trace extension definition from the XES metadata structure.

5 — XML name: trace.

6 **6.3.1 Elements**

7 The following (sub) elements should appear in the specified order.

<i>XML name</i>	<i>XESEXT element</i>	<i>Min</i>	<i>Max</i>	<i>Description</i>
attribute	Attribute, see 6.6.	0	∞	Attribute definition for traces.

8 **6.3.2 Attributes**

9 N/A.

10 **6.4 Event element**

11 Captures the event definition from the XES metadata structure.

12 — XML name: event.

13 **6.4.1 Elements**

14 The following (sub) elements should appear in the specified order.

<i>XML name</i>	<i>XESEXT element</i>	<i>Min</i>	<i>Max</i>	<i>Description</i>
attribute	Attribute, see 6.6.	0	∞	Attribute definition for events.

15 **6.4.2 Attributes**

16 N/A.

1 **6.5 Meta element**

2 Captures the meta (attribute) extension definition from the XES metadata structure.

3 — XML name: meta.

4 **6.5.1 Elements**

5 The following (sub) elements should appear in the specified order.

<i>XML name</i>	<i>XESEXT element</i>	<i>Min</i>	<i>Max</i>	<i>Description</i>
attribute	Attribute, see 6.6.	0	∞	Attribute definition for attributes.

6 **6.5.2 Attributes**

7 N/A.

8 **6.6 Attribute element**

9 Captures the attribute extension element from the XES metadata structure. Can be any of the following:

<i>XML name</i>	<i>Description</i>
string	A string valued attribute.
date	A date and time valued attribute.
int	An integer number valued attribute.
float	A real number valued attribute.
boolean	A Boolean valued attribute.
id	A UUID valued attribute.
list	A list valued attribute.

10 **6.6.1 Elements**

11 The following (sub) elements should appear in the specified order.

<i>XML name</i>	<i>XESEXT element</i>	<i>Min</i>	<i>Max</i>	<i>Description</i>
alias	Attribute, see 6.7.	0	∞	Aliases for this attribute.

1 **6.6.2 Attributes**

<i>Attribute key</i>	<i>Attribute type</i>	<i>Status</i>	<i>Description</i>
key	xs:string	Required	The key of the attribute.

2 **6.7 Alias**

3 Captures the alias extension element from the XES metadata structure.

4 **6.7.1 Elements**

5 N/A.

6 **6.7.2 Attributes**

<i>Attribute key</i>	<i>Attribute type</i>	<i>Status</i>	<i>Description</i>
mapping	xs:NCName	Required	The language code (using the ISO 639-1 and 639-2 Standards) for this alias.
name	xs:string	Required	The semantics of this attribute described using the language with the given code.

1

2

Figure 3 State machine diagram for XESEXT XML serialization

3

7. XES standard extensions

4

5

6

7

XES shall recognize and treat all extensions as equal, independent from their source. This allows users of the format to extend it, in order to fit any purpose or domain setting. However, there are recurring requirements for information stored in event logs, which demand a fixed and universally understood semantics. For this purpose, a number of extensions have been standardized. When creating logs for a

1 specific domain, or also when designing log-analyzing techniques, one should consider using these
2 standardized extensions, since they allow for a wider level of understanding of the contents of event logs.

3 In the following, the currently standardized extensions to the XES formats are introduced.

4 7.1 Concept extension

5 The Concept extension defines, for all levels of the XES type hierarchy, an attribute which stores the
6 generally understood name of type hierarchy elements.

<i>Name</i>	<i>Prefix</i>	<i>URI</i>
Concept	concept	http://www.xes-standard.org/concept.xesext

7 7.1.1 Attributes

<i>Name</i>	<i>Key</i>	<i>Components</i>	<i>Datatype</i>	<i>Description</i>
Name	name	Log Trace Event	xs:string	Stores a generally understood name for any component type. For streams and logs, the name attribute may store the name of the process having been executed. For traces, the name attribute usually stores the case ID. For events, the name attribute represents the name of the event, e.g. the name of the executed activity represented by the event.
Instance	instance	Event	xs:string	This represents an identifier of the activity instance whose execution has generated the event. This way, multiple instances (occurrences) of the same activity can be told apart.

8 7.2 Lifecycle extension

9 The Lifecycle extension specifies for events the lifecycle transition they represent in a transactional model
10 of their generating activity. This transactional model can be arbitrary. However, the Lifecycle extension
11 also specifies a standard transactional model for activities, see the figure that follows. The use of this
12 extension is appropriate in any setting where events denote lifecycle transitions of higher-level activities.

<i>Name</i>	<i>Prefix</i>	<i>URI</i>
Lifecycle	lifecycle	http://www.xes-standard.org/lifecycle.xesext

1 **7.2.1 Attributes**

<i>Name</i>	<i>Key</i>	<i>Components</i>	<i>Datatype</i>	<i>Description</i>
Model	model	Log	xs:string	This attribute refers to the lifecycle transactional model used for all events in the log. If this attribute has a value of standard, the standard lifecycle transactional model of this extension is assumed. If it has a value of bpaF, the BPAF lifecycle transactional model is assumed.
Transition	transition	Event	xs:string	The transition attribute is defined for events, and specifies the lifecycle transition of each event.
State	state	Event	xs:string	The state attribute is defined for events, and specifies the lifecycle state of each event.

2 **7.2.2 BPAF lifecycle transactional model**

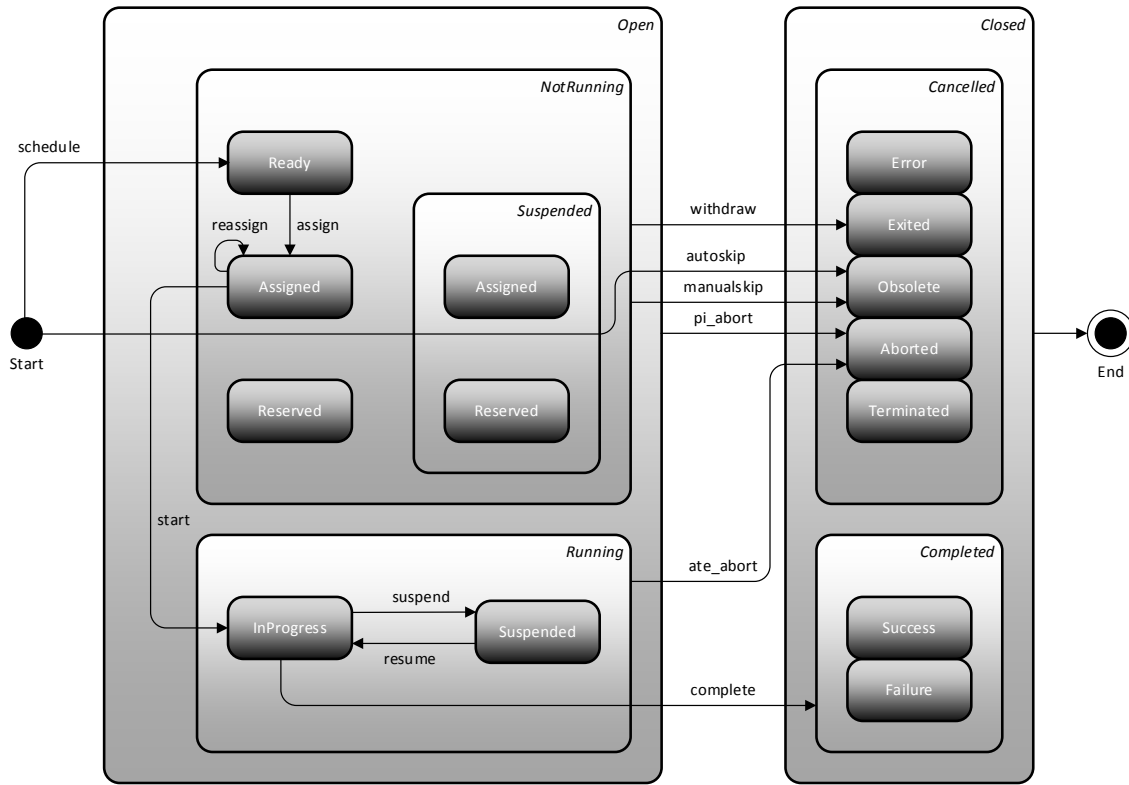

3

4 **Figure 4 State machine for the BPAF transactional model**

5 Note that the transition shown in this figure are the most typical transitions, but manual interventions and
 6 different system implementations may lead to additional transitions not depicted in the model.

<i>State</i>	<i>Description</i>
Closed	The activity is closed for execution.
Closed.Cancelled	The execution of the activity is cancelled.
Closed.Cancelled.Aborted	The execution of the activity is aborted.
Closed.Cancelled.Error	The execution of the activity is in error.
Closed.Cancelled.Exited	The execution of the activity is exited manually.
Closed.Cancelled.Obsolete	The execution of the activity is obsolete (e.g. in case of a timeout).
Closed.Cancelled.Terminated	The execution of the activity is forcibly terminated.
Completed	The execution of the activity is completed, i.e., it has ended naturally.
Completed.Failed	The execution of the activity is completed, but the result is unsuccessful (from a business perspective).
Completed.Success	The execution of the activity is completed, and the result is successful (from a business perspective).
Open	The activity is open for execution.
Open.NotRunning	The execution of the activity is not on-going.
Open.NotRunning.Assigned	The activity is on the worklists of resources.
Open.NotRunning.Reserved	The activity has been selected by a resource to work on.
Open.NotRunning.Suspended.Assigned	The activity is on the worklists of resources, but is barred from execution.
Open.NotRunning.Suspended.Reserved	The activity has been selected by a resource, but is barred from execution.
Open.Running	The execution of the activity is on-going.
Open.Running.InProgress	The execution of the activity is in progress.
Open.Running.Suspended	The execution of the activity is on-going, but not in progress.

1 **7.2.3 Standard lifecycle transition model**

2

3 **Figure 5 State machine for the standard transactional model**

4 In contrast with the BPAF transactional model, the standard lifecycle model uses the transitions instead of
 5 the states to denote the new state of an activity.

<i>Transition</i>	<i>From State</i>	<i>To State</i>	<i>Description</i>
assign	Open. NotRunning. Ready	Open. NotRunning. Assigned	The activity is assigned for execution to a resource.
ate_abort	Open. Running	Closed. Cancelled. Aborted	The execution of the activity is aborted, the execution of the corresponding case is not aborted. As a result, execution of the activity has failed.
autoskip	Start	Closed. Cancelled. Obsolete	The execution of the activity is skipped by the system. As a result, execution of the activity has succeeded.
complete	Open. Running. InProgress	Closed. Completed	The execution of the activity is completed. As a result, execution of the activity has succeeded.
manualskip	Open.	Closed. Cancelled.	The execution of the activity is skipped by the user. As a

	NotRunning	Obsolete	result, execution of the activity has succeeded.
pi_abort	Open	Closed. Cancelled. Aborted	The execution of the activity is aborted, the execution of the corresponding case is also aborted. As a result, execution of the activity has failed.
reassign	Open. NotRunning. Assigned	Open. NotRunning. Assigned	The activity has been reassigned for execution to another resource
resume	Open. Running. Suspended	Open. Running. InProgress	The execution of the activity is resumed.
schedule	Start	Open. NotRunning. Ready	The activity is scheduled for execution.
start	Open. NotRunning. Assigned	Open. Running. InProgress	The execution of the activity is started.
suspend	Open. Running. InProgress	Open. Running. Suspended	The execution of the activity is suspended.
unknown	Any	Any	Any lifecycle transition not captured by any of the other transitions.
withdraw	Open. NotRunning	Closed. Cancelled. Exited	The assignment of the activity is revoked. As a result, execution of the activity has failed.

1 **7.3 Organizational extension**

2 The organizational extension is useful for domains, where events can be caused by human actors, who are
3 somewhat part of an organizational structure. This extension specifies three attributes for events, which
4 identify the actor having caused the event, and his position in the organizational structure.

<i>Name</i>	<i>Prefix</i>	<i>URI</i>
Organizational	org	http://www.xes-standard.org/org.xesext

5 **7.3.1 Attributes**

<i>Name</i>	<i>Key</i>	<i>Components</i>	<i>Datatype</i>	<i>Description</i>
Resource	resource	Event	xs:string	The name, or identifier, of the resource that triggered the event.

Role	role	Event	xs:string	The role of the resource that triggered the event, within the organizational structure.
Group	Group	Event	xs:string	The group within the organizational structure, of which the resource that triggered the event is a member.

1 7.4 Time extension

2 In almost all applications, the exact date and time at which events occur can be precisely recorded. Storing
3 this information is the purpose of the time extension. Recording a timestamp for events is important, since
4 this constitutes crucial information for many event log analysis techniques.

<i>Name</i>	<i>Prefix</i>	<i>URI</i>
Time	time	http://www.xes-standard.org/time.xesext

5 7.4.1 Attributes

<i>Name</i>	<i>Key</i>	<i>Components</i>	<i>Datatype</i>	<i>Description</i>
Time	timestamp	Event	xs:dateTime	The date and time at which the event occurred.

6 7.5 Semantic extension

7 Depending on the view on a process, type hierarchy artifacts may correspond to different concepts. For
8 example, the name of an event (as specified by the Concept extension) may refer to the activity whose
9 execution has triggered this event. However, this activity may be situated on a low level in the process
10 meta-model, and be a part of higher-level, aggregate activities itself.

11 Besides events, also other elements of the XES type hierarchy may refer to a number of concepts at the
12 same time (e.g., a log may refer to different process definitions, on different levels of abstractions). To
13 express the fact, that one type artifact may represent a number of concepts in a process meta-model, the
14 semantic extension has been defined.

15 It is assumed that there exists an ontology for the process meta-model, where every concept can be
16 identified by a unique URI. The semantic extension defines an attribute, which allows to store a number of
17 model references, as URIs, in any element of the XES type hierarchy.

<i>Name</i>	<i>Prefix</i>	<i>URI</i>
Semantic	semantic	http://www.xes-standard.org/semantic.xesext

1 **7.5.1 Attributes**

<i>Name</i>	<i>Key</i>	<i>Components</i>	<i>Datatype</i>	<i>Description</i>
Model reference	modelReference	Log Trace Event Meta	xs:string	References to model concepts in an ontology. Model References are stored in a literal string, as comma-separated URIs identifying the ontology concepts.

2 **7.6 ID extension**

3 The ID extension provides unique identifiers (UUIDs) for elements.

<i>Name</i>	<i>Prefix</i>	<i>URI</i>
Identity	identity	http://www.xes-standard.org/identity.xesext

4 **7.6.1 Attributes**

<i>Name</i>	<i>Key</i>	<i>Components</i>	<i>Datatype</i>	<i>Description</i>
Id	id	Log Trace Event Meta	ID	Unique identifier (UUID) for an element.

5 **7.7 Cost extension**

6 The cost extension defines a nested element to store information about the cost associated with activities
 7 within a log. The objective of this extension is to provide semantics to cost aspects that can be associated
 8 with events in a log. The definition associates three data elements with a particular cost element: the
 9 amount associated with the cost element as well as the cost driver that is responsible for incurring that cost
 10 and the cost type. As it is possible for more than one cost element to be associated with an event, the cost
 11 incurred per event is summarized using the `total` attribute. The `currency` element is also recorded
 12 once per event. Cost information can be recorded at the trace level (for instance, to be able to say that it
 13 costs \$20 when a case is started). Cost information can also be recorded at the event level (for instance, for
 14 certain event types such as complete or canceled events) to capture the cost incurred in undertaking the
 15 activity by a resource.

<i>Name</i>	<i>Prefix</i>	<i>URI</i>
Cost	cost	http://www.xes-standard.org/cost.xesext

1 7.7.1 Attributes

<i>Name</i>	<i>Key</i>	<i>Components</i>	<i>Datatype</i>	<i>Description</i>
Total	total	Trace Event	xs:double	Total cost incurred for a trace or an event. The value represents the sum of all the cost amounts within the element.
Currency	currency	Trace Event	xs:string	The currency (using the ISO 4217:2008 Standard) of all costs of this element.
Drivers	drivers	Trace Event	List	A detailed list containing cost driver details.
Amount	amount	Meta	xs:double	The value contains the cost amount for a cost driver.
Driver	driver	Meta	xs:string	The value contains the id for the cost driver.
Type	type	Meta	xs:string	The value contains the cost type (e.g., Fixed, Overhead, Materials).

2 The `drivers` attribute shall contain any number of `driver` attributes, and every `driver` attribute shall
 3 contain the `amount` and `type` attribute, like follows:

```

4 <event>
5   <string key="cost:currency" value="AUD" />
6   <string key="cost:total" value="123.50" />
7   <list key="cost:drivers">
8     <values>
9       <string key="driver" value="d2f4ee27">
10        <float key="amount" value="21.40" />
11        <string key="type" value="Labour" />
12      </string>
13      <string key="driver" value="abc124">
14        <float key="amount" value="102.10" />
15        <string key="type" value="Variable Overhead" />
16      </string>
17    </values>
18  </list>
19 </event>
    
```

20 8. XES Conformance

21 Conformance to the XES part of this Standard is discussed in 8.1 and 8.2. In 8.1 and 8.2, *strictly*
 22 *conforming XES XML instance* and *conforming XES XML instance* refer to the metadata represented in the
 23 XES XML instance before any processing of the XES XML instance.

1 **8.1 Strictly conforming XES instances**

2 A strictly conforming XES instance shall consist solely of XES data elements as defined in Clause 4, and
3 shall conform to the requirements of Clause 4. A strictly conforming XES XML instance

- 4 • Shall be a strictly conforming XES instance as defined before
- 5 • Shall conform to the requirements of Clause 5
- 6 • Shall not include XML elements or attributes that are not defined in Clause 5
- 7 • Shall not include mixed content

8 **8.2 Conforming XES instances**

9 A conforming XES instance may contain XES data elements as defined in Clause 4, and shall conform to
10 the requirements of Clause 4. A conforming XES XML instance

- 11 • Shall be a conforming XES instance as defined before
- 12 • Shall conform to the requirements of Clause 5
- 13 • May include XML elements or attributes that are not defined in Clause 5
- 14 • May include mixed content

15 **9. XESEXT Conformance**

16 Conformance to the XESEXT part of this Standard is discussed in 9.1 and 9.2. In 9.1 and 9.2, *strictly*
17 *conforming XESEXT XML instance* and *conforming XESEXT XML instance* refer to the metadata
18 represented in the XESEXT XML instance before any processing of the XESEXT XML instance.

19 **9.1 Strictly conforming XESEXT instances**

20 A strictly conforming XESEXT instance shall consist solely of XESEXT data elements as defined in
21 Clause 4.5, and shall conform to the requirements of Clause 4.5. A strictly conforming XESEXT XML
22 instance

- 23 • Shall be a strictly conforming XES instance as defined before
- 24 • Shall conform to the requirements of Clause 6
- 25 • Shall not include XML elements or attributes that are not defined in Clause 6
- 26 • Shall not include mixed content

1 **9.2 Conforming XEEXT instances**

2 A conforming XEEXT instance may contain XEEXT data elements as defined in Clause 4.5, and shall
3 conform to the requirements of Clause 4.5. A conforming XES XML instance

- 4
- Shall be a conforming XES instance as defined before
- 5
- Shall conform to the requirements of Clause 6
- 6
- May include XML elements or attributes that are not defined in Clause 6
- 7
- May include mixed content

1 **Annex A**

2 (informative)

3 **History of XES**

4 Unlike classical process analysis tools which are purely model-based (like simulation models), process
5 mining requires event logs. Fortunately, today's systems provide detailed event logs. Process mining has
6 emerged as a way to analyze systems (and their actual use) based on the event logs they produce [B1],
7 [B2], [B3], [B4], [B6], [B24]. Note that, unlike classical data mining, the focus of process mining is on
8 concurrent processes and not on static or mainly sequential structures. Also note that commercial Business
9 Intelligence (BI for short) tools are not doing any process mining. They typically look at aggregate data
10 seen from an external perspective (including frequencies, averages, utilization levels, and service levels).
11 Unlike BI tools, process mining looks "inside the process" and allows for insights at a much more refined
12 level.

13 The omnipresence of event logs is an important enabler of process mining, as analysis of run-time behavior
14 is only possible if events are recorded. Fortunately, all kinds of information systems provide such logs,
15 which include classical workflow management systems like FileNet and Staffware, ERP systems like SAP,
16 case handling systems like BPM[one], PDM systems like Windchill, CRM systems like Microsoft Dynamics
17 CRM, and hospital information systems like Chipsoft. These systems provide very detailed information
18 about the activities that have been executed.

19 However, also all kinds of embedded systems increasingly log events. An embedded system is a special-
20 purpose system in which the computer is completely encapsulated by or dedicated to the device or system it
21 controls. Examples include medical systems like X-ray machines, mobile phones, car entertainment
22 systems, production systems like wafer steppers, copiers, and sensor networks. Software plays an
23 increasingly important role in such systems and, already today, many of these systems log events. An
24 example is the "CUSTOMerCARE Remote Services Network" of Philips Medical Systems (PMS for
25 short), which is a worldwide internet-based private network that links PMS equipment to remote service
26 centers. Any event that occurs within an X-ray machine (like moving the table or setting the deflector) is
27 recorded and can be analyzed remotely by PMS. The logging capabilities of the machines of PMS illustrate
28 the way in which embedded systems produce event logs.

29 The MXML format [B10] has proven its use as a standard event log format in process mining. However,
30 based on practical experiences with applying MXML in about one hundred organizations, several problems
31 and limitations related to the MXML format have been discovered. One of the main problems is the
32 semantics of additional attributes stored in the event log. In MXML, these are all treated as string values
33 with a key and have no generally understood meaning. Another problem is the nomenclature used for
34 different concepts. This is caused by MXML's assumption that strictly structured process would be stored
35 in this format [B11].

36 To solve the problems encountered with MXML and to create a standard that could also be used to store
37 event logs from many different information systems directly, a new event log format was developed. This
38 new event log format is named XES, which stands for eXtensible Event Stream [B30]. This XES standard
39 has been adopted for standardization by the IEEE Task Force Process Mining [B11].

1 **Annex B**

2 (informative)

3 **Current status of XES**

4 At the moment, there already exists a XES standard [B15] (which has not been endorsed by the IEEE),
5 which comes with a reference implementation called OpenXES [B12]. The IEEE XES Standard differs
6 from the XES 2.0 standard in the following respects (see also [B28]):

- 7 • Events in logs. In the XES 2.0 standard, every event had to be contained in some trace. In the
8 IEEE XES Standard, events may also be contained by the log itself.
- 9 • Classifiers use ordered attribute keys. In the XES 2.0 standard, a classifier corresponds to a set of
10 attribute keys. In the IEEE XES Standard, a classifier corresponds to a list of attribute keys.
- 11 • Trace classifier. In the XES 2.0 standard, only event classifiers were defined. In the IEEE XES
12 Standard, also a trace classifier is defined, which allows to classify an entire trace. This can be
13 useful in case the events in that trace lack the attributes for a corresponding event classifier.
- 14 • List attribute values. In the XES 2.0 standard, a list could not have any metadata as all attributes of
15 the list were considered to be values of this list. In the IEEE XES Standard, there is a new element
16 called `values` to hold the list values, which allows for the list metadata.
- 17 • Container attributes. In the XES 2.0 standard, a container attribute was defined. In the IEEE XES
18 Standard, this attribute has been dropped. The list attribute suffices.
- 19 • Lifecycle extension. In the XES 2.0 standard, only the transition labels were defined. In the IEEE
20 XES Standard, also the state labels (as introduced by [B20]) are used.

1 **Annex C**

2 (informative)

3 **XES support**

4 **C.1 Tool support**

5 The latest version of the XES standard, 2.0, is supported by the following tools:

- 6 • AProMore [B28], an advanced process model repository.
- 7 • Celonis Process Mining [B5], a process mining tool that retrieves and visualizes all of the process
8 data saved in your IT systems.
- 9 • CoBeFra [B22], a comprehensive benchmarking framework for conformance checking.
- 10 • CoPrA Tool [B31], a tool for communication analysis and process mining of team processes.
- 11 • Disco [B11], a process mining tool that helps you to discover your processes.
- 12 • Flipflop [B21], a test and Flip net synthesis tool for the automated synthesis of surgical procedure
13 models.
- 14 • JIRAVIEW [B18], a tool to extract data from JIRA through REST and create charts.
- 15 • Lean Document Production [B25] toolkit, a Xerox toolkit [B32] to model and analyze complex
16 print operations.
- 17 • OpenXES [B12], The XES reference implementation, an Open Source Java library for reading,
18 storing, and writing XES logs.
- 19 • PMLAB [B31], a scripting environment for Process Mining in Python, which allows to perform
20 exploratory process-oriented computing and/or research in a process-oriented language.
- 21 • ProM 6 [B13], an extensible Process Mining framework, which is basically the breeding ground
22 for many new process mining related techniques.
- 23 • RapidProM [B14], a ProM 6 Framework extension to RapidMiner 5.3.
- 24 • Rialto PI (Process Intelligence). The Rialto suite [B16] from Exeura covers Data Mining, Text
25 Mining, Reasoning and Process Mining in one single environment.
- 26 • ruby-xes [B29], a Ruby library for generating XES event log.
- 27 • XES Python Tool [B24], a simple Python tool for generating XES files for Process Mining.
- 28 • XESame, a tool for extracting XES logs from databased, distributed with ProM 6.

- 1 • YAWL [B33], a BPM/Workflow system, based on a concise and powerful modelling language,
2 that handles complex data transformations, and full integration with organizational resources and
3 external Web Services.

4 **C.2 Data support**

5 A number of datasets have been published that use the XES standard:

- 6 • A real-life log from 5 Dutch Municipalities containing all building permit applications over a
7 period of approximately five years [B8].
- 8 • A real-life log from a Dutch Financial Institute which contains some 262.200 events in 13.087
9 cases [B7].
- 10 • A real-life log from a Dutch Academic Hospital which contains some 150.000 events in over 1100
11 cases [B9].
- 12 • A real-life log from Volvo IT Belgium [B27]. The log contains events from an incident and
13 problem management system called VINST.

14 These datasets are publicly available and can be used as benchmark datasets for many Computational
15 Intelligence techniques. The use of the DOIs makes it easy to refer to the datasets.

16 **C.3 Publication support**

17 The XES standard has appeared in a number of publications:

1 Annex D

2 (informative)

3 XESEXT Example

4 We have chosen the Semantic Extension (see 7.5) to exemplify the XESEXT format for XES extensions.
5 This extension defines, on each level of abstraction (log, trace, event, and meta), the same string-based
6 attribute `modelReference`. Attributes can be defined on all four levels of abstraction, similar to attribute
7 declarations in XES (while omitting the value attribute). For every defined attribute, the XESEXT
8 document may feature an arbitrary number of alias mappings as child elements. These mappings define a
9 human-readable alias for the attribute within a given namespace (typically a country code, used for
10 localization).

```
11 <?xml version="1.0" encoding="UTF-8" ?>
12 <xesextension name="Semantic"
13     prefix="semantic"
14     uri="http://code.fluxicon.com/xes/semantic.xesext">
15
16     <log>
17         <string key="modelReference">
18             <alias mapping="EN" name="Ontology Model Reference" >
19                 <alias mapping="DE" name="Ontologie-Modellreferenz" />
20                 <alias mapping="FR" name="Référence au Modèle Ontologique" />
21                 <alias mapping="ES" name="Referencia de Modelo Ontológico" />
22                 <alias mapping="PT" name="Referência de Modelo Ontológico" />
23             </string>
24         </log>
25

1 **Annex R**

2 (informative)

3 **Revision history**

4 This annex contains the revision history of this Standards proposal, and is to be omitted from the final
5 Standard proposal.

6 **R.1 May 21st, 2015: Initial revision**

7 **R.2 June 1st, 2015: Created annex for tool, data, and publication support**

- 8
 - Fixed some typos.

9 **R.3 June 2nd, 2015: Fixed citation style to Chicago.**

- 10
 - Resorted citations accordingly.

11
 - Fixed references to citations.

12 **R.4 June 26th, 2015: Comments of Moe Wynn, fixed some other glitches.**

- 13
 - Textual changes based on comments of Moe.

14
 - Fixed event notation in Clause 4.4.3.

15
 - Fixed undefined references in Clause 8 and Clause 9.

16 **R.5 June 29th, 2015: Comments of Lijie Wen.**

- 17
 - Textual changes based on comments of Lijie.

18 **R.6 June 30th, 2015: Comments of JC Bose and Walter van Herle.**

- 19
 - Added Xerox Lean Document Production toolkit, as suggested by JC Bose, together with two

20
 - references.

21
 - Added Rialto PI, as suggested by Walter van Herle, together with a reference.

22 **R.7 July 10th, 2015: Comments of Alexander Rinke.**

- 23
 - Added Celonis Process Mining tool, as suggested by Alexander Rinke.

- 1
- Updated all fields.

2 **R.8 October 2nd, 2015: Comments of Josep Carmona.**

- 3
- Added PMLAB as tool that supports XES, with a reference.

- 4
- Added all members to the WG.

- 5
- Updated month in header.

6
