

# $(0, 2)$ -graphs

Andries Brouwer

02/11/2005

During GAC3 the question was raised whether it is possible to find all small rectagraphs. That is mostly a programming problem, and the answer is yes. The result is a bunch of large 0-1 matrices, mostly of new, so far unknown structures. Now the question arises whether one can make mathematical sense out of the 0-1 mess and give nice mathematical descriptions.
