# One-point extensions of classical generalized hexagons 

An De Wispelare<br>02/11/05

We prove the uniqueness of the one-point extension of a generalized hexagon, $\Gamma$, of order 2 , provided the following property holds: call $S$ a first extension of $\Gamma$. Then for any three points $x, y$ and $z$ the distance from $y$ to $z$ in the derived generalized hexagon $S_{x}$ is the same as from $x$ to $z$ in $S_{y}$.
