THE ATTACK

COMPLEXITY

EXAMPLES

HERMITIAN CURVES

SUZUKI CURVES

- Let  $\mathcal{F}$  be any family of linear codes with an **efficient decoding algorithm**.
- Every element of  $\mathcal{F}$  is represented by the triple  $(C, \mathcal{A}_C, t)$

$\mathcal{A}_C = A$  decoding algorithm for  $C \in \mathcal{F}$  which corrects up to  $t$  errors.

## KEY GENERATION

Given:

- Any element  $(C, \mathcal{A}_C, t) \in \mathcal{F}$ .
- $G$  a **non structured** gen. matrix of  $C$ .

1 **McEliece Public Key:**  $\mathcal{K}_{pub} = (G, t)$

2 **McEliece Private Key:**  $\mathcal{K}_{secret} = (\mathcal{A}_C)$

## ENCRYPTION

Encrypt a message  $\mathbf{m} \in \mathbb{F}_q^k$  as

$$\mathbf{y} = \mathbf{m}G + \mathbf{e}$$

where  $\mathbf{e}$  is a random error vector of weight at most  $t$ .

## DECRYPTION

Using  $\mathcal{K}_{secret}$ , the receiver obtain  $\mathbf{m}$ .

- McEliece introduced the first PKC based on **Error-Correcting Codes** in 1978.
- **Advantages:**
  - 1 Interesting candidate for post-quantum cryptography.
  - 2 Fast encryption (matrix-vector multiplication) and decryption functions.
- **Drawback:** Large key size.

R. J. McEliece.

*A public-key cryptosystem based on algebraic coding theory.*

# ATTACKS ON THE McELIECE PKC II

## STRUCTURAL ATTACKS:

Retrieve the code structure rather than use an unspecific decoding algorithm.

- Distinguishing a prescribed structured code from a random one.
- Structural attacks were efficiently applied to: Reed Solomon codes (Sidelnikov-Shestakov, 1992), Reed-Müller codes (Minder-Shokrollahi, 2007), Concatenated codes (Sendrier, 1994) and some special cases of AG codes.

HERMITIAN CURVES

SUZUKI CURVES

- Let  $\mathcal{X}$  be an algebraic curve of genus  $g$  over the finite field  $\mathbb{F}_q$ .
- $\mathcal{Q} = (Q_1, \dots, Q_n)$  be an  $n$ -tuple of mutually distinct  $\mathbb{F}_q$ -rational points of  $\mathcal{X}$ .

$D_{\mathcal{Q}}$  denotes the divisor  $D_{\mathcal{Q}} = Q_1 + \dots + Q_n$

- $F$  be an  $\mathbb{F}_q$ -divisor of  $\mathcal{X}$  such that

$$\text{supp}(F) \cap \text{supp}(D_{\mathcal{Q}}) = \emptyset$$

Since  $\text{supp}(F) \cap \text{supp}(D_{\mathcal{Q}}) = \emptyset$  the following **evaluation map** is well defined:

$$\begin{aligned} \text{ev}_{\mathcal{Q}} : L(F) &\longrightarrow \mathbb{F}_q^n \\ f &\longmapsto \text{ev}_{\mathcal{Q}}(f) = (f(Q_1), \dots, f(Q_n)) \end{aligned}$$

## ALGEBRAIC GEOMETRY CODE (AG CODE)

The **AG code** associated to the triplet  $(\mathcal{X}, \mathcal{Q}, F)$  is:

$$C_L(\mathcal{X}, \mathcal{Q}, F) = \{ \text{ev}_{\mathcal{Q}}(f) = (f(Q_1), \dots, f(Q_n)) \mid f \in L(F) \}$$

## ERROR-CORRECTING PAIRS (ECP)

Let  $C$  be an  $\mathbb{F}_q$  linear code of length  $n$ . The pair  $(A, B)$  of  $\mathbb{F}_{q^m}$ -linear codes of length  $n$  is a  $t$ -ECP for  $C$  over  $\mathbb{F}_{q^m}$  if the following properties hold:

$$E.1 \quad (A * B) \perp C.$$

$$E.2 \quad k(A) > t.$$

$$E.3 \quad d(B^\perp) > t.$$

$$E.4 \quad d(A) + d(C) > n.$$

An  $[n, k]$  code which has a  $t$ -ECP over  $\mathbb{F}_{q^m}$   
has a decoding algorithm with complexity  
 $\mathcal{O}((nm)^3)$ .

THE ATTACK

COMPLEXITY

EXAMPLES

HERMITIAN CURVES

SUZUKI CURVES

Consider the AG code  $\mathcal{C} = \mathcal{C}_L(\mathcal{X}, \mathcal{Q}, F)^\perp$  where

- $\mathcal{X}$  is an algebraic curve of genus  $g$  over  $\mathbb{F}_q$
- $\mathcal{Q} = (Q_1, \dots, Q_n)$  is an  $n$ -tuple of mutually distinct  $\mathbb{F}_q$ -rational points of  $\mathcal{X}$ .
- $F$  is an  $\mathbb{F}_q$ -divisor of  $\mathcal{X}$  such that

$$\deg(F) = m > 3g - 1 \quad \text{and} \quad \text{supp}(F) \cap \text{supp}(D_{\mathcal{Q}}) = \emptyset$$

## THEOREM [PELLIKAAN - 1992]

The pair of codes  $(A, B)$  defined by

$$A = \mathcal{C}_L(\mathcal{X}, \mathcal{Q}, E) \quad \text{and} \quad B = \mathcal{C}_L(\mathcal{X}, \mathcal{Q}, F - E)$$

with  $m > \deg(E) \geq t + g$  is a  $t$ -ECP for  $\mathcal{C}$ .

Such a pair always exists whenever  $m > 2g - 2$  and  $t = \left\lfloor \frac{d^* - 1 - g}{2} \right\rfloor$ .

## COROLLARY [MAIN COROLLARY]

Let us define  $A_0 = (B * \mathcal{C})^\perp$ . Then  $(A_0, B)$  is a  $t$ -ECP for  $\mathcal{C}$

In order to compute a  $t$ -ECP for  $\mathcal{C}$ , it suffices to compute a code of type  $\mathcal{C}_L(\mathcal{X}, \mathcal{Q}, F - E)$  for some divisor  $E$  with  $\deg(E) \geq t + g$ .

THE ATTACK

COMPLEXITY

EXAMPLES

HERMITIAN CURVES

SUZUKI CURVES

From now on:

- $\mathcal{X}$  is an algebraic curve of genus  $g$  over  $\mathbb{F}_q$
- $\mathcal{Q} = (Q_1, \dots, Q_n)$  is an  $n$ -tuple of mutually distinct  $\mathbb{F}_q$ -rational points of  $\mathcal{X}$ .
- $F$  is an  $\mathbb{F}_q$ -divisor of  $\mathcal{X}$  such that

$$\deg(F) = m > 3g - 1 \quad \text{and} \quad \text{supp}(F) \cap \text{supp}(D_{\mathcal{Q}}) = \emptyset$$

**Public Key:**

$$\mathcal{K}_{\text{pub}} = G \quad \text{and} \quad t = \left\lfloor \frac{d^* - g - 1}{2} \right\rfloor$$

where:

- $G$  is a generator matrix of the **public code**:

$$\mathcal{C}_{\text{pub}} = \mathcal{C}_L(\mathcal{X}, \mathcal{Q}, F)^\perp$$

- $d^* = m - 2g + 2$  is the designed minimum distance of  $\mathcal{C}_{\text{pub}}$

- Our  $t$  seems reasonable if  $\mathcal{K}_{\text{secret}}$  is based on ECP.

$$t = \left\lfloor \frac{d^* - g - 1}{2} \right\rfloor \leq \left\lfloor \frac{d^* - 1}{2} \right\rfloor = \text{actual error-correction capability of } \mathcal{C}$$

- **Future work!!!**

THE ATTACK

COMPLEXITY

EXAMPLES

HERMITIAN CURVES

SUZUKI CURVES

- Let  $P$  be a point of the  $n$ -tuple  $\mathcal{Q}$ .
- We focus on the sequence of codes:

$$B_i := (C_L(\mathcal{X}, \mathcal{Q}, F - iP))_{i \in \mathbb{N}}$$

## WHICH ELEMENTS OF THE SEQUENCE DO WE KNOW?

- 1 From a generator matrix of  $C_{\text{pub}} = C_L(\mathcal{X}, \mathcal{Q}, F)^\perp$  one can compute  $C_L(\mathcal{X}, \mathcal{Q}, F)$ 
  - Computed by **Gaussian elimination**.
- 2  $B_0$  = the code  $C_L(\mathcal{X}, \mathcal{Q}, F)$  **punctured** at position  $P$ .
- 3  $B_1$  = the code  $C_L(\mathcal{X}, \mathcal{Q}, F)$  **shortened** at position  $P$ .
  - Computed by **Gaussian elimination**.

The codes  $B_0$  and  $B_1$  are **known**.

## How to compute $\mathcal{B}_2$ ?

→ If  $\frac{n+1+g}{2} > m$ , then  $\mathcal{B}_1^{(2)} \subsetneq \mathbb{F}_q^n$ .

→ If  $\deg(F - P) = m - 1 \geq 2g + 1$ , then

$$\mathcal{B}_1^{(2)} = \mathcal{C}_L(\mathcal{X}, \mathcal{Q}, F - P)^{(2)} = \mathcal{C}_L(\mathcal{X}, \mathcal{Q}, 2F - 2P)$$

Therefore if  $\frac{n+1+g}{2} > m \geq 2g + 1$  then  $\mathcal{B}_2$  is the solution space of the following problem

$$\mathbf{z} \in \mathcal{B}_1 \quad \text{and} \quad \mathbf{z} * \mathcal{B}_0 \subseteq (\mathcal{B}_1)^{(2)}. \quad (1)$$

## PROPOSITION

Let  $F, G$  two divisors on  $\mathcal{X}$  such that  $\deg(F) \geq 2g$  and  $\deg(G) \geq 2g + 1$ . Then,

$$\mathcal{C}_L(\mathcal{X}, \mathcal{Q}, F) * \mathcal{C}_L(\mathcal{X}, \mathcal{Q}, G) = \mathcal{C}_L(\mathcal{X}, \mathcal{Q}, F + G)$$

## THEOREM I

If  $s \geq 1$  and  $\frac{n+1+g}{2} > m \geq 2g + s + 1$ , then  $\mathcal{B}_{s+1}$  is the solution space of the following problem

$$\mathbf{z} \in \mathcal{B}_s \quad \text{and} \quad \mathbf{z} * \mathcal{B}_{s-1} \subseteq (\mathcal{B}_s)^{(2)}. \quad (2)$$

$(t + g)$  repeated applications of **Theorem I** determines the code  $\mathcal{B}_{t+g}$ .

---

**Algorithm 5.1:** Let  $\frac{n+1+g}{2} > m \geq 3g + t + 1$

---

**Data:** Generator matrices for the codes  $\mathcal{B}_0$  and  $\mathcal{B}_1$

**Result:** A generator matrix for the code  $\mathcal{B}_{t+g}$

**for**  $s = 2, \dots, t + g$  **do**

    | Compute  $\mathcal{B}_s$  from the codes  $\mathcal{B}_{s-1}$  and  $\mathcal{B}_{s-2}$  using **Theorem I**.

---

**Algorithm complexity:** We solve  $(t + g)$  systems of linear equations of type (2).

---

## THEOREM II

If  $\frac{n+1+g}{2} > m \geq 2g + \lfloor \frac{s}{2} \rfloor + 1$ , then  $\mathcal{B}_s$  is the solution space of the following problem

$$\mathbf{z} \in \mathcal{B}_{\lfloor s/2 \rfloor} \quad \text{and} \quad \mathbf{z} * \mathcal{B}_0 \subseteq \mathcal{B}_{\lfloor s/2 \rfloor} * \mathcal{B}_{\lfloor s/2 \rfloor + 1}. \quad (3)$$

---

**Algorithm 5.2:** Let  $\frac{n+1+g}{2} > m \geq \frac{5g+t}{2} + 1$

---

**Data:** Generator matrices for the codes  $\mathcal{B}_0$  and  $\mathcal{B}_1$

**Result:** A generator matrix for the code  $\mathcal{B}_{t+g}$

Let  $b = \lfloor \log_2 n \rfloor + 1$ , then  $n$  satisfies:  $2^{b-1} \leq n < 2^b$ . Therefore,  $2 \leq n/2^{b-2} < 4$ .

Compute  $\mathcal{B}_2$  and  $\mathcal{B}_3$  using **Theorem I**;

**for**  $s = b - 2, \dots, 1$  **do**

    Compute the codes  $\mathcal{B}_{\lfloor (t+g)/2^s - 1 \rfloor}$  and  $\mathcal{B}_{\lfloor (t+g)/2^s - 1 \rfloor + 1}$  from the codes  $\mathcal{B}_{\lfloor (t+g)/2^s \rfloor}$  and  $\mathcal{B}_{\lfloor (t+g)/2^s \rfloor + 1}$  by applying twice **Theorem II**

---

**Algorithm complexity:** We solve  $2 \lceil \log_2(t+g) \rceil + 2$  systems of linear equations of type (2) and (3).

---

We have been working under the assumption that

$$m \leq \frac{n+1+g}{2}$$

On the following we see **how this conditions can be weakened!!!**.

## THE CODE $C(J)$

Let  $J \subseteq \{1, \dots, n\}$ . We define the code  $C(J)$  as:

$$C(J) = \{c \in C \mid c_j = 0, \text{ for all } j \in J\}$$

## LEMMA I §5.2

Let  $I \subseteq \{2, \dots, n\}$  with  $|I| = i$  elements and  $Q_1, \dots, Q_n$  be  $n$  different rational points. Take the code

$$B_1(I) = C_L(\mathcal{X}, \mathcal{Q}, F - Q_1 - \sum_{j \in I} Q_j).$$

If  $\frac{n+i+g}{2} > m \geq 2g+1$ , then  $(B_1(I))^{(2)} \not\subseteq \mathbb{F}_q^{n-i-1}$ .

THE ATTACK

COMPLEXITY

EXAMPLES

HERMITIAN CURVES

SUZUKI CURVES

**Unfortunately** the codes  $B_i$  are **degenerated** for  $i > 0$ .

→ The following result allows to compute a generator matrix of

$$\underbrace{C_L(\mathcal{X}, \mathcal{Q}, F - E')}_{\text{with } \text{supp}(F - E') \cap \text{supp}(D_{\mathcal{Q}}) = \emptyset} \quad \text{from the codes } B_{t+g} \text{ and } B_{t+g+1}.$$

## THEOREM

Let  $G$  be a generator matrix of  $B_{t+g}$  of the form:

$$G = \left( \begin{array}{c|c} 0 & \mathbf{c}_1 \\ \hline & G_1 \end{array} \right), \text{ where}$$

$$\left( 0 \mid \mathbf{c}_1 \right) \in B_{t+g} \setminus B_{t+g-1} \quad \text{and} \quad \left( \mathbf{0} \mid G_1 \right) \text{ is a gen. matrix of } B_{t+g+1}$$

Then the following matrix is a generator matrix for a code of type

$$C_L(\mathcal{X}, \mathcal{Q}, F - E') \text{ with } \text{supp}(F - E') \cap \text{supp}(D_{\mathcal{Q}})$$

$$\hat{G} = \left( \begin{array}{c|c} 1 & \mathbf{c}_1 \\ \hline \mathbf{0} & G_1 \end{array} \right)$$

HERMITIAN CURVES

SUZUKI CURVES

**Public Key:**  $\mathcal{K}_{\text{pub}} = G$  and  $t = \left\lfloor \frac{d^* - g - 1}{2} \right\rfloor$  where:

- $G$  is a generator matrix of the **public code**:  $C_{\text{pub}} = C_L(\mathcal{X}, \mathcal{Q}, F)^\perp$
- $d^* = m - 2g + 2$  is the designed minimum distance of  $C_{\text{pub}}$

## The Algorithm:

Suppose that  $\frac{n+1+g}{2} \geq m$ . Otherwise we apply techniques set on §5.2

**STEP 1.** Determine the values  $g$  and  $m$  using the following Proposition.

### PROPOSITION

If  $2g + 1 \leq m < \frac{1}{2}n$ . Let  $k_1$  and  $k_2$  be the dimension of  $C$  and  $C^{(2)}$ , respectively. Then,

$$m = k_2 - k_1 \quad \text{and} \quad g = k_2 - 2k_1 + 1.$$

**STEP 2.** Compute  $C_L(\mathcal{X}, \mathcal{Q}, F)$  by Gaussian elimination.

**STEP 3.** Compute the code  $B = C_L(\mathcal{X}, \mathcal{Q}, F - (t + g)P_1)$ , using one of the algorithms described in §5.1

**STEP 4.** Deduce from  $B$  a non degenerated code  $\hat{B}$  using §5.3

**STEP 5.** Apply the following Corollary to deduce an ECP. from  $\hat{B}$ .

### COROLLARY

Let us define  $A_0 = (B * C)^\perp$ . Then  $(A_0, B)$  is a  $t$ -ECP for  $C$ .

THE ATTACK

COMPLEXITY

EXAMPLES

HERMITIAN CURVES

SUZUKI CURVES

→ The **costly part** of the attack is the computation of the code  $B$

⇒ We can apply one of the algorithms of §5.1

Computing a generator matrix of  $\mathcal{C}^{(2)}$  and then apply Gaussian elimination to such matrix has complexity:

$$O\left(\binom{k}{2}n + \binom{k}{2}n^2\right) \sim O(k^2n^2).$$

→ Roughly speaking the cost of our attack is about  $O((\lambda + 1)n^4)$  where:

- 1  $\lambda$  = Linear systems to solve depending on the chosen algorithm from §5.1
- 2 The term  $(\lambda + 1)$  is due to §5.3
