Parity games

Recall:

Definition (Parity game)

A parity game Γ is a four tuple $(V, E, p, (V_{Even}, V_{Odd}))$, where:

- (V, E) is a directed graph,
 - E is a total edge relation,
 - $p : V \rightarrow \mathbf{N}$ assigns priorities to vertices, and
 - (V_{Even}, V_{Odd}) is a partitioning of V
-
- A player does a step in the game if a token is on a vertex owned by that player;
 - A play (denoted π) is an infinite sequence of steps.

Notation

Let $G = (V, E, p, (V_{Even}, V_{Odd}))$ be a parity game.

We use the following notation:

- 0 for *Even*, 1 for *Odd*
- $1 - \text{Even}$ is *Odd*, $1 - \text{Odd}$ is *Even*
- $vE = \{v' \mid (v, v') \in E\}$
- $G \setminus U$ is parity game G restricted to the vertices outside U .
Formally $G \setminus U = (V', E', p', (V'_{Even}, V'_{Odd}))$, with
 - $V' = V \setminus U$,
 - $E' = E \cap (V \setminus U)^2$,
 - $p'(v) = p(v)$ for $v \in V \setminus U$,
 - $V'_{Even} = V_{Even} \setminus U$, and
 - $V'_{Odd} = V_{Odd} \setminus U$

Strategies

- A **strategy** for *Player* is a partial function $\psi_{Player}: V^* \times V_{Player} \rightarrow V$.
- A play $\pi = v_1 v_2 v_3 \dots$ is **consistent** with strategy ψ_{Player} for *Player* iff every $v_i \in \pi$ such that $v_i \in V_{Player}$ is immediately followed by $v_{i+1} = \psi_{Player}(v_1 \dots v_i)$.

Definition (Memoryless strategy)

A **memoryless strategy** for *Player* is a partial function $\psi_{Player}: V_{Player} \rightarrow V$ that decides the vertex the token is played to based on the current vertex.

Winning a parity game

Let $\pi = v_1 v_2 v_3 \dots$ be a play:

- $\text{inf}(\pi)$ denotes set of priorities occurring infinitely often in π ;
- π is winning for player *Even* iff $\min(\text{inf}(\pi))$ is **even**;

Definition (Winning strategy)

Strategy ψ_{Player} is a **winning strategy** for *Player* from set $W \subseteq V$ if every play starting from a vertex in W , consistent with ψ_{Player} is winning for *Player*.

- There is a memoryless winning strategy for *Player* from $W \subseteq V$ **iff** there is a winning strategy for *Player* from W .

Goal

Let $G = (V, E, p, (V_{Even}, V_{Odd}))$ be a parity game.

- There is a **unique** partition (W_{Even}, W_{Odd}) of V such that:
 - *Even* has winning strategy ψ_{Even} from W_{Even} , and
 - *Odd* has winning strategy ψ_{Odd} from W_{Odd} .

Goal of parity game algorithms

Compute partitioning (W_{Even}, W_{Odd}) with strategies ψ_{Even} and ψ_{Odd} of V , such that ψ_{Even} is winning for player *Even* from W_{Even} and ψ_{Odd} is winning for player *Odd* from W_{Odd} .

Attractor sets

The attractor set for *Player* and set $U \subseteq V$ is the set of vertices such that *Player* can **force** any play to reach U .

Definition

Let $U \subseteq V$. We define the **attractor** sets inductively as follows:

$$\text{Attr}_{\text{Player}}^0(G, U) = U$$

$$\begin{aligned} \text{Attr}_{\text{Player}}^{k+1}(G, U) &= \text{Attr}_{\text{Player}}^k(G, U) \\ &\cup (V_{\text{Player}} \cap \{v \mid vE \cap \text{Attr}_{\text{Player}}^k(G, U) \neq \emptyset\}) \\ &\cup (V_{1-\text{Player}} \cap \{v \mid vE \subseteq \text{Attr}_{\text{Player}}^k(G, U)\}) \end{aligned}$$

$$\text{Attr}_{\text{Player}}(G, U) = \bigcup_{k \in \mathbb{N}} \text{Attr}_{\text{Player}}^k(G, U)$$

Example of attractor sets

Example

Consider parity game G :

Legend: \square Odd \diamond Even

Compute:

- $Attr_0(G, \{Z\})$
- $Attr_1(G, \{W\})$

Example of attractor sets

Example

Consider parity game G :

Compute:

- $Attr_0(G, \{Z\}) = \{Z, X', W\}$
- $Attr_1(G, \{W\}) = \{W, Y\}$

Observations

Let $U \subseteq V$. Let $A = Attr_{Even}(G, U)$.

- *Even cannot escape* from $V \setminus A$. If it could, there would be an edge $(v, v') \in E$, such that $v \in V_{Even} \setminus A$, and $v' \in A$, but then by definition also $v \in A$, which is not the case.
- *Odd cannot escape* from A . If it could, there would be an edge $(v, v') \in E$, such that $v \in V_{Odd} \cap A$, and $v' \notin A$, but then by definition $v \notin A$.

Observations

Let $U \subseteq V$. Let $A = Attr_{Even}(G, U)$.

Assume:

- X_{Odd} is winning set for *Odd* on $G \setminus A$;
- $B = Attr_{Odd}(G, X_{Odd})$;
- Y_{Even} is winning set for *Even* on $G \setminus B$;
- Y_{Odd} is winning set for *Odd* on $G \setminus B$.

Then:

- Player *Even* can never leave B ;
- Player *Odd* can never leave $V \setminus B$;
- A winning strategy for player *Odd* in $G \setminus (V \setminus B)$ from $V_{Odd} \cap B$ is also a winning strategy for player *Odd* in G from $V_{Odd} \cap B$.

Recursive algorithm (McNaughton '93, Zielonka '98)

Recursively solve a parity game: $Recursive(G)$. Returns partitioning (W_{Even}, W_{Odd}) such that $Even$ wins from W_{Even} , and Odd wins from W_{Odd} .

Base case:

- 1: **if** $V_G = \emptyset$ **then**
- 2: $W_{Even} \leftarrow \emptyset$
- 3: $W_{Odd} \leftarrow \emptyset$
- 4: **return** (W_{Even}, W_{Odd})
- 5: **end if**

Inductive case (1):

- 6: $m \leftarrow \min\{p(v) \mid v \in V\}$ (* Paper: max; assumes max parity game model, we use min parity games *)
- 7: $Player \leftarrow m \bmod 2$
- 8: $U \leftarrow \{v \in V \mid p(v) = m\}$
- 9: $A \leftarrow Attr_{Player}(G, U)$
- 10: $(X_{Even}, X_{Odd}) \leftarrow Recursive(G \setminus A)$
- 11: **if** $X_{1-Player} = \emptyset$ **then**
- 12: $W_{Player} \leftarrow A \cup X_{Player}$
- 13: $W_{1-Player} \leftarrow \emptyset$
- 14: **else**
- 15: ...
- 19: **end if**
- 20: **return** (W_{Even}, W_{Odd})

Inductive case (2):

```
6:  $m \leftarrow \min\{p(v) \mid v \in V\}$ 
7:  $Player \leftarrow m \bmod 2$ 
8:  $U \leftarrow \{v \in V \mid p(v) = m\}$ 
9:  $A \leftarrow Attr_{Player}(G, U)$ 
10:  $(X_{Even}, X_{Odd}) \leftarrow Recursive(G \setminus A)$ 
11: if  $X_{1-Player} = \emptyset$  then
12:   ...
14: else
15:    $B \leftarrow Attr_{1-Player}(G, X_{1-Player})$ 
16:    $(Y_{Even}, Y_{Odd}) \leftarrow Recursive(G \setminus B)$ 
17:    $W_{Player} \leftarrow Y_{Player}$ 
18:    $W_{1-Player} \leftarrow B \cup Y_{1-Player}$ 
19: end if
20: return  $(W_{Even}, W_{Odd})$ 
```

Example ($Recursive(G)$)

Consider parity game G :

- 6: $m \leftarrow 1$
- 7: $Player \leftarrow Odd$
- 8: $U \leftarrow \{v \in V \mid p(v) = 1\} = \{X, X'\}$
- 9: $A \leftarrow Attr_{Odd}(G, U) = \{X, X'\}$
- 10: $(X_{Even}, X_{Odd}) \leftarrow Recursive(G \setminus \{X, X'\})$

Legend: \square *Odd* \diamond *Even*

Example ($Recursive(G \setminus \{X, X'\})$)

Consider parity game

 $G \setminus \{X, X'\}$:Legend: \square Odd \diamond Even

- 6: $m \leftarrow 2$
- 7: $Player \leftarrow Even$
- 8: $U \leftarrow \{v \in V \setminus \{X, X'\} \mid p(v) = 2\} = \{Y, Y'\}$
- 9: $A \leftarrow Attr_{Even}(G \setminus \{X, X'\}, U) = \{Y, Y'\}$
- 10: $(X_{Even}, X_{Odd}) \leftarrow Recursive(G \setminus \{X, X', Y, Y'\})$

Example ($Recursive(G \setminus \{X, X', Y, Y'\})$)

Consider parity game
 $G \setminus \{X, X', Y, Y'\}$:

```

6:  $m \leftarrow 3$ 
7:  $Player \leftarrow Odd$ 
8:  $U \leftarrow \{v \in V \setminus \{X, X', Y, Y'\} \mid p(v) = 3\} = \{W, Z, Z'\}$ 
9:  $A \leftarrow Attr_{Odd}(G \setminus \{X, X', Y, Y'\}, U) = \{W, Z, Z'\}$ 
10:  $(X_{Even}, X_{Odd}) \leftarrow Recursive(G \setminus V) = (\emptyset, \emptyset)$ 
11: if  $X_{Even} = \emptyset$  then
12:    $W_{Odd} \leftarrow A \cup X_{Odd} = A = \{W, Z, Z'\}$ 
13:    $W_{Even} \leftarrow \emptyset$ 
14: else
15:   ...
19: end if
20: return  $(W_{Even}, W_{Odd}) = (\emptyset, \{W, Z, Z'\})$ 

```

Legend: \square Odd \diamond Even

Example ($Recursive(G \setminus \{X, X'\})$)

Consider parity game
 $G \setminus \{X, X'\}$:

- 6: $m \leftarrow 2$
- 7: $Player \leftarrow Even$
- 8: $U \leftarrow \{v \in V \setminus \{X, X'\} \mid p(v) = 2\} = \{Y, Y'\}$
- 9: $A \leftarrow Attr_{Even}(G \setminus \{X, X'\}, U) = \{Y, Y'\}$
- 10: $(X_{Even}, X_{Odd}) \leftarrow Recursive(G \setminus \{X, X', Y, Y'\}) = (\emptyset, \{Z, Z', W\})$
- 11: **if** $X_{Odd} = \emptyset$ **then**
- 12: ...
- 14: **else**
- 15: $B \leftarrow Attr_{Odd}(G, X_{Odd}) = \{Y, Y', Z, Z', W\}$
- 16: $(Y_{Even}, Y_{Odd}) \leftarrow Recursive(G \setminus V) = (\emptyset, \emptyset)$
- 17: $W_{Even} \leftarrow Y_{Even} = \emptyset$
- 18: $W_{Odd} \leftarrow B \cup Y_{Odd} = B = \{Y, Y', Z, Z', W\}$
- 19: **end if**
- 20: **return** $(W_{Even}, W_{Odd}) = (\emptyset, \{Y, Y', Z, Z', W\})$

Example (*Recursive(G)*)

Consider parity game G :

Legend:

```

6:  $m \leftarrow 1$ 
7:  $Player \leftarrow Odd$ 
8:  $U \leftarrow \{v \in V \mid p(v) = 1\} = \{X, X'\}$ 
9:  $A \leftarrow Attr_{Odd}(G, U) = \{X, X'\}$ 
10:  $(X_{Even}, X_{Odd}) \leftarrow Recursive(G \setminus \{X, X'\}) =$ 
     $(\emptyset, \{Y, Y', Z, Z', W\})$ 
11: if  $X_{Even} = \emptyset$  then
12:    $W_{Odd} \leftarrow A \cup X_{Even} = \{X, X', Y, Y', Z, Z', W\}$ 
13:    $W_{Even} \leftarrow \emptyset$ 
14: else
15:   ...
19: end if
20: return  $(W_{Even}, W_{Odd}) =$ 
     $(\emptyset, \{X, X', Y, Y', Z, Z', W\})$ 

```

Example (*Recursive(G)*)

Consider parity game G :

So, player *Odd* wins from **all** vertices!

Legend: \square *Odd* \diamond *Even*

Complexity

Let $G = (V, E, p, (V_{Even}, V_{Odd}))$ be a parity game;
 $n = |V|, e = |E|, d = \max\{p(v) \mid v \in V\}$.

Worst-case running time complexity:

$$\mathcal{O}(e \cdot n^d)$$

Lowerbound on worst-case:

$$\Omega(\text{fib}(n)) = \Omega\left(\left(\frac{1 + \sqrt{5}}{2}\right)^n\right)$$

Complexity

Let $G = (V, E, p, (V_{Even}, V_{Odd}))$ be a parity game;
 $n = |V|, e = |E|, d = \max\{p(v) \mid v \in V\}$.

- Algorithm with best known upper bound: **Big step** algorithm due to Schewe, with complexity

$$\mathcal{O}(d \cdot n^{d/3})$$

- Big step combines recursive algorithm with **small progress measures**;
- Small progress measures will be discussed first lecture in January

Exercise

Consider the following parity game:

Legend: \square *Odd* \diamond *Even*

- Compute the winning sets W_{Even} , W_{Odd} for players *Even* and *Odd* in this parity game using the recursive algorithm.
- Translate this parity game to BES and solve the BES using Gauss elimination.
